Subject: Anatomy of Silver Manipulation - How Low Can It Go? - Seeking Alpha

<http://seekingalpha.com/article/268691-anatomy-of-silver-manipulation-how-low-can-it-go>

But the exchange and its dealers don't play the game that way. Instead, they apply these changes to everyone, even people who may have bought when silver was down near \$18 per ounce, even though these older position holders pose no greater risk of defaulting than before. The exchange committee members are quite expert at all this, and are well aware that the net effect of what they were doing would be to throw people involuntarily out of positions. The effect is carefully calculated and thought out, and is part of the overall process used to artificially control silver prices.

Coupled with the sudden increased performance in bonds, there has been an all-out media effort to convince people that a "bubble is bursting" even though, as we will shortly explain, anyone who is worth his salt as an analyst knows it isn't true. There has NEVER been any bubble in silver in 2011, and therefore, it cannot possibly "burst". There has simply been an unwinding of a grossly underpriced asset that has been subject to a multi-year price suppression effort.
