P R O C E E D I N G S

2 MS. GOLDSMITH: Good morning, everyone. Thank  
3 you for joining.

20                   Please ensure that your phone is unmuted  
21                   before you start to speak, that you speak clearly into  
22                   your phone, and that you re-mute your line when you are

1           done speaking.

2                 For GMAC members and commissioners, if you  
3           would like to be recognized during the discussion  
4           portion, please use the WebEx chat icon at the bottom of  
5           your screen, select the "All Panelists" option within  
6           the dropdown menu, indicate that you have a comment or  
7           question, and press ENTER.

8                 If any meeting participant needs assistance  
9           during the call, please dial \*0 to connect to the  
10          conference operator or message me directly within the  
11          WebEx chat.

12                 Finally, please keep your telephone line muted  
13          when you are not speaking. If you do not mute your  
14          line, the conference operator may need to mute it for  
15          you.

16                 I would now like to turn things over to the  
17          GMAC sponsor, Commissioner Dawn Stump, for her opening  
18          remarks. Commissioner Stump?

19                 COMMISSIONER STUMP: Thank you, Andrée.

20                 Good morning and welcome. I want to begin by  
21          thanking our Acting Chairman Behnam and my fellow  
22          Commissioners for attending today's meeting. We look

1 forward to your contributions to our discussion, and it  
2 is much appreciated that you are able to attend today.

3 I also want to recognize that due to the  
4 global nature of this committee, there are many  
5 participating in less-than-ideal local time zones. And  
6 I am extremely grateful for your willingness to do so.

7 I would especially like to thank all of  
8 today's esteemed presenters for being here and for  
9 taking the time out of your busy schedules to contribute  
10 to today's important discussion. Additionally, I would  
11 like to thank Chair Angie Karna for her leadership of  
12 the GMAC and Andrée Goldsmith, the GMAC Designated  
13 Federal Officer, for organizing today's meeting.

14 I also want to welcome Dr. Janet Kong, our  
15 newest member to the GMAC, who is CEO of trading and  
16 shipping for bp Americas. Welcome, Dr. Kong. And we  
17 look forward to your participation with the GMAC  
18 membership. And I would also like to thank Clive  
19 Christison for his previous service to the GMAC  
20 representing bp.

21 Today's meeting will focus on two distinct  
22 topics. The first panel will feature presentations

1       about recent trends in retail investing activity and the  
2       impact on the global derivatives markets. Dr. Mel  
3       Gunewardena, Chief Market Intelligence Officer; and  
4       Eugene Kunda, Market Analyst in the Market Intelligence  
5       Branch of the CFTC's Division of Market Oversight, will  
6       present the data surrounding the recent retail  
7       investment activity and the effect of such activity in  
8       the markets that the CFTC oversees and the indirect  
9       effect from retail activity in other markets.

10                  Following their presentation, Jonathan Lave,  
11                  Associate Director in the Division of Market Oversight,  
12                  will provide an overview of some of the CFTC's core  
13                  principles for designated contract markets and their  
14                  particular relevance to retail market participants.

15                  Our last presentation in Panel 1 will be from  
16                  Alison Beer, senior legal counsel in the Derivatives  
17                  Branch at the Ontario Securities Commission. She will  
18                  describe how the OSC oversees transactions by retail  
19                  market users and the differences in the OSC's approach  
20                  to retail investors versus that of the CFTC.

21                  We have all seen increased activity and  
22                  developments regarding retail participation in many of

1       the markets that we are interested in. And the trend,  
2       should it be here to stay, is one that I am hopeful  
3       today's discussion will assist in our efforts to ensure  
4       that retail market participants are adequately educated  
5       and protected.

6                  The second panel will continue the discussion  
7       from the GMAC's last meeting, in December, on the impact  
8       of the COVID-19 pandemic on the global clearing  
9       ecosystem. Since our last meeting, market participants  
10      and regulators around the world have continued to  
11      analyze the impact of the pandemic on central clearing.  
12      And there are a number of additional perspectives that  
13      our presenters will share. First, we will hear from  
14      Pedro Gurrola-Perez, Head of Research at the World  
15      Federation of Exchanges, who will highlight how CCP and  
16      margin procyclicality should be approached from a  
17      systemic perspective.

18                  Second, Nicholas Lincoln, Group Head of Market  
19      Risk and Liquidity Risk at LCH Group, will demonstrate  
20      how LCH's margin model responded to the pandemic-related  
21      market volatility.

1                   Lastly, Ulrich Karl, head of clearing services  
2                   at ISDA, will present a clearing members' perspective  
3                   on CCP margin requirements during the pandemic,  
4                   including recommendations for decreasing the  
5                   procyclicality of CCP margin calls in times of increased  
6                   volatility.

7                   I am hopeful that these presentations will  
8                   provide a starting point for a continuation of the robust  
9                   discussion among the GMAC members that we started in  
10                  December. I am cognizant that there continue to be many  
11                  ongoing dialogues regarding lessons learned from the  
12                  market volatility in the spring of 2020. My hope in  
13                  providing a forum to continue this dialogue is to help  
14                  ensure that the global clearing system remains resilient in  
15                  the face of future market stresses.

16                  I am very much looking forward to all of this  
17                  morning's presentations. And, again, I want to thank our  
18                  panelists for being here today and furthering these  
19                  important conversations.

20                  I would also like to take this opportunity to  
21                  reflect on the important work of the GMAC in the area of

1 margin requirements on transactions not subject to  
2 central clearing. In May 2020, the GMAC adopted a  
3 number of recommendations for the Commission to consider  
4 regarding the implementation of margin requirements for  
5 non-cleared swaps. Since then, the Commission has acted  
6 on a number of these recommendations, and we continue to  
7 consider many of the others. In addition, due to the  
8 pandemic, the Commission, along with its fellow  
9 regulators around the world, extended the implementation  
10 dates for phase 5 and phase 6 of the uncleared margin rules to  
11 September 1, 2021 and September 1, 2022.

12 As the phase 5 implementation date approaches,  
13 I am hopeful that the Commission's actions have made it  
14 easier for those firms who will come into scope on  
15 September 1st to ensure that they are able to comply  
16 with the uncleared margin rules. However, I am cognizant  
17 of reports that some phase 5 firms may not yet be  
18 properly preparing. And many are still scrambling at  
19 this late date to complete the required documentation  
20 and set up the required custodial accounts. These  
21 reports are somewhat alarming.

1                   The purpose of the one-year extension was to  
2 provide firms with the necessary breathing room to  
3 ensure that they would be in a position to begin  
4 exchanging margin on the implementation date, while also  
5 adjusting to a sudden remote working environment. For  
6 those firms that have yet to enter into the requisite  
7 custodial and vendor agreements, I just would like to  
8 say the time to do so is now. And I encourage focus in  
9 this area.

10                  Thank you again to everyone for being here  
11 today. And I very much look forward to the meeting.  
12 Back to you, Andrée.

13                  MS. GOLDSMITH: Thank you, Commissioner Stump.

14                  Chairman Behnam?

15                  CFTC ACTING CHAIRMAN BEHNAM: Thank you,  
16 Andrée. And good morning, good afternoon, or good  
17 evening, wherever you may be, to everyone who is  
18 listening or participating in today's GMAC. Special  
19 thanks to Commissioner Stump for her leadership on these  
20 important issues.

21                  The GMAC has been really phenomenal, certainly  
22 in the past year during the COVID crisis and the

1 discussions around market fragility and stability that  
2 we have all experienced. But certainly, as a general  
3 matter, whether it is clearinghouse risk or margin  
4 issues, and certainly today's discussion around retail  
5 trading, these are the most ripe and important issues  
6 that I think we all care about in our market. They are  
7 welcome discussions from a Commission's perspective,  
8 certainly from mine, so that we can get experts and we  
9 can have an open dialogue about what we can all do to  
10 collectively make our markets better.

11                   Certainly a special thanks to Andrée Goldsmith  
12 for her leadership as DFO; Angie Karna as Chair; and a  
13 big welcome to the new members of the GMAC; and also  
14 welcome back to the existing members and thank you for  
15 your participation; and, of course, the panelists who  
16 will be speaking today.

17                   It is pretty remarkable to think that it has  
18 just been about a year since we all sort of shut down  
19 from COVID. And now we have I think a lot to look  
20 forward to but certainly much to get through in the next  
21 coming months. But we can certainly look forward to  
22 2021, learning many lessons from 2020, both from the

1           markets perspective, but also health perspective and from  
2           certainly a work and family perspective. So I am very  
3           pleased that we are still able to have these meetings,  
4           to have dialogue and discuss these important issues.  
5           They are extremely important to the Commission, to me,  
6           and my colleagues.

7                 And just a special thanks to all of the  
8           members and the participants for sharing their views  
9           today. Thanks again to Commissioner Stump for her  
10           leadership. And, Andrée, I will send it back to you.

11                MS. GOLDSMITH: Thank you, Chairman Behnam.

12                Commissioner Quintenz?

13                COMMISSIONER QUINTENZ: Thank you. And good  
14           morning or welcome to everyone listening and participating today.  
15           I also would like to thank Commissioner Stump for her tireless  
16           leadership of the GMAC and the multitude of issues they have been  
17           able to explore over the last number of months and years that  
18           have had a critical impact on Commission policymaking  
19           and in trying to evolve for the integrity of our  
20           markets. Certainly today's topics are some that could  
21           be included in that, lessons learned, or ideas to carry

1 forward, from some of the most dramatic moments in the  
2 derivatives industry I think over any period of time  
3 that we could look. And, yet, the markets operated  
4 extraordinarily well, with integrity and resilience, and it's  
5 something I think all of us can be very proud of.

6 Also, looking forward today to hearing a  
7 presentation by our Market Intelligence Branch. They  
8 are a true asset to the Commission. The work is vital to  
9 our understanding of the markets. And I think it is  
10 crucially important that their research is shared within  
11 the advisory committee to gain insight from market  
12 experts and feedback so that we can better understand  
13 market participants' perspectives and our own research,  
14 market participants can understand how we are looking at  
15 and evaluating market dynamics.

16 Thanks again to all of the members of the  
17 GMAC; all of the participants today for your  
18 preparation; once again, to Commissioner Stump and  
19 Andrée and Angie for your leadership. Thank you.

20 MS. GOLDSMITH: Thank you, Commissioner  
21 Quintenz.

22 Commissioner Berkovitz?

1                   COMMISSIONER BERKOVITZ: Thank you, Andrée.

2         And thank you, Commissioner Stump, for your leadership  
3         of this excellent committee. And thank you, Angie,  
4         Angie Karna, for your leadership on the committee as  
5         well.

6                   This is yet another excellent agenda by the  
7         GMAC. We have come to expect, really, very timely,  
8         informative discussions at these GMAC meetings. And  
9         today it will be no exception. The two topics that we  
10      are going to be discussing are extraordinarily timely.

11     Looking back at what happened, at 2020, truly an  
12      extraordinary year globally, obviously health-wise but  
13      also with respect to the global derivatives markets.

14     And as we continue to analyze and try and understand how  
15      the markets performed and what lessons are learned going  
16      forward, the input of this committee certainly is crucial to  
17      that.

18     The first panel that we have today, Trends in  
19      Retail Investing, and the presentations by MIB and DMO  
20      and the Ontario Securities Commission, also very timely.  
21      We have obviously seen most dramatically in the equities  
22      markets some of the impacts of retail, greater retail

1 participation. And we are seeing at the Commission  
2 greater retail interest in terms of licensed facilities  
3 and expectations and market participants working to meet  
4 what they see as a new demand by this class of market  
5 participants. And I think it is absolutely critical  
6 that we stay abreast with the curve on this, that we get  
7 ahead of this and be aware of the implications for this  
8 increase in retail investing. So I am very much looking  
9 forward to our presentations today on that.

10 I would like to thank the CFTC staff for  
11 presenting today and those who worked to support the  
12 presentations. I know it takes a lot of work and  
13 analysis to go into this and present to this global  
14 audience. So I thank the CFTC staff. And, then, I  
15 also, again, thank Commissioner Stump for her leadership  
16 in really setting forth today an excellent agenda.

17 I look forward to the discussions. Thank you.

18 MS. GOLDSMITH: Thank you, Commissioner  
19 Berkovitz.

20 Thanks again to all of the Commissioners for  
21 taking part in this meeting of the GMAC and for sharing  
22 your remarks with the committee.

1                   Before we begin with our presentations today,  
2                   I would like to do a roll call of the GMAC members on  
3                   the phone so that we have your attendance on the record.  
4                   After I say your name and firm, please indicate that you  
5                   are present.

6                   Angie Karna, Nomura Securities International?

7                   CHAIRPERSON KARNA: Present, Andrée.

8                   MS. GOLDSMITH: Chris Allen, Standard  
9                   Chartered Bank?

10                  MR. ALLEN: Present.

11                  MS. GOLDSMITH: Ted Backer, Morgan Stanley?

12                  (No response.)

13                  MS. GOLDSMITH: Ashley Belich, RBC Capital  
14                  Markets?

15                  (No response.)

16                  MS. GOLDSMITH: Shawn Bernardo, TP ICAP SEF?

17                  (No response.)

18                  MS. GOLDSMITH: Darcy Bradbury, D.E. Shaw &  
19                  Co.?

20                  MS. BRADBURY: Present.

21                  MS. GOLDSMITH: Maria Chioldi, Credit Suisse  
22                  Securities?

1 MS. CHIODI: Present.

2 MS. GOLDSMITH: Joe Cisewski, Better Markets?

3 (No response.)

4 MS. GOLDSMITH: Jim Colby, Coalition for

5 Derivatives End-Users?

6 (No response.)

7 MS. GOLDSMITH: Gerry Corcoran, R.J. O'Brien

8 and Associates?

9 (No response.)

10 MS. GOLDSMITH: Sunil Cutinho, CME Clearing?

11 MR. CUTINHO: Present.

12 MS. GOLDSMITH: Thank you.

13 David Goone, Intercontinental Exchange?

14 MR. GOONE: Present.

15 MS. GOLDSMITH: Thank you.

16 Paul Hamill, Citadel Securities?

17 MR. HAMILL: Present.

18 MS. GOLDSMITH: Great. Thank you.

19 Amy Hong, Goldman Sachs?

20 (No response.)

21 MS. GOLDSMITH: John Horkan, LCH Group?

22 MR. HORKAN: Present. Thank you.

1 MS. GOLDSMITH: Thank you very much.

2 Adam Kansler, IHS Markit?

3 (No response.)

4 MS. GOLDSMITH: Bob Klein, Citigroup Global  
5 Markets?

6 MR. KLEIN: I'm present. Thank you.

7 MS. GOLDSMITH: Thank you.

8 Agnes Koh, Singapore Exchange?

9 MS. KOH: Present.

10 MS. GOLDSMITH: Thank you.

11 Janet Kong, bp Americas?

12 MS. KONG: Present.

13 MS. GOLDSMITH: Thank you.

14 Ben MacDonald, Bloomberg?

15 MR. MacDONALD: Present.

16 MS. GOLDSMITH: Thanks. Erik Müller, Eurex  
17 Clearing AG?

18 MR. MÜLLER: Present. Thank you.

19 MS. GOLDSMITH: Thank you.

20 Joe Nicosia, Louis Dreyfus Company?

21 (No response.)

22 MS. GOLDSMITH: Murray Pozmanter, DTCC?

1 MR. POZMANTER: Present. Thanks.

2 MS. GOLDSMITH: Thank you.

3 Tom Sexton, NFA?

4 MR. SEXTON: Present.

5 MS. GOLDSMITH: Thank you.

6 Jessica Sohl, HC Technologies?

7 MS. SOHL: Present. Thank you.

8 MS. GOLDSMITH: Thank you very much.

9 Thane Twiggs, Cargill Risk Management?

10 MR. TWIGGS: I am present. Thank you.

11 MS. GOLDSMITH: Okay. Supurna VedBrat,

12 BlackRock?

13 MS. VedBRAT: Present.

14 MS. GOLDSMITH: Thank you very much.

15 And Masahiro Yamada, JPMorgan Securities?

16 MR. YAMADA: I'm present.

17 MS. GOLDSMITH: Thank you.

18 If there were any GMAC members that were unable  
19 to indicate your presence on the call, please email me  
20 or message me directly in the WebEx chat to confirm your  
21 attendance for the record.

22 And, with that, I would like to turn the

1 program over to Angie Karna, chair of the GMAC, for an  
2 introduction of our presenters on panel 1.

3 CHAIRPERSON KARNA: Thank you, Andrée.

4 Just a few logistical reminders. Please keep  
5 your phones on mute while you are not speaking.

6 Following the presentations, if a GMAC member or a  
7 commissioner would like to be recognized to speak,  
8 please use the WebEx chat icon at the bottom of your  
9 screen. Then select the "All Panelists" option within  
10 the dropdown menu, indicate that you have a question,  
11 and press ENTER. Please identify yourself and your firm  
12 prior to speaking and indicate when you are finished  
13 speaking.

14 Our first panel will focus on retail  
15 activities in the global derivatives markets. Our first  
16 presenters are Mel Gunewardena, Chief Markets  
17 Intelligence Officer; and Eugene Kunda, Market Analyst,  
18 from the Market Intelligence Branch of the CFTC's Division  
19 of Market Oversight.

20 Please go ahead, gentlemen.

21 MR. GUNEWARDENA: Thank you, Chairman Karna.

22 Good morning, Commissioner Stump, Chairman Behnam,

1           Commissioner Quintenz, Commissioner Berkovitz, and  
2       members of the committee. I am Mel Gunewardena from the  
3       Market Intelligence Branch in the Division of Market  
4       Oversight. And, along with my colleague Gene Kunda, also  
5       from MIB, we will be speaking today on this important topic.  
6       We thank you for allowing us to share some of the  
7       ongoing work on the retail influence on the derivatives  
8       markets.

9                           Just let me begin by saying that our views  
10      today represent only those of the staff in the Market  
11      Intelligence Branch who have worked on this initiative  
12      and do not necessarily reflect the Commodity Futures  
13      Trading Commission's view, Chairman, or any other  
14      Commissioners or staff at the Commission.

15                          Additionally, consistent with section 8(a) of  
16      the CEA, our presentation does not contain data or  
17      information that would separately disclose the business  
18      transactions or market positions of any person, any trade  
19      secrets, or names of persons.

20                          Very briefly, the Market Intelligence Branch  
21      within the Division of Market Oversight monitors the

1       health, performance, and structure of U.S. futures,  
2       options, and swaps markets, which we call the  
3       derivatives markets, highlighting and responding to  
4       emerging trends, threats, structural and systemic risks  
5       to the Chairman, Commissioners, and staff at the CFTC.

6                  The Market Intelligence Branch has been  
7       undertaking an ongoing initiative to analyze the retail  
8       influence on the derivatives market microstructure. As  
9       you know, a microstructural analysis focuses on trading  
10      venues, the price discovery process, determinants of  
11      the spreads, price quotes, liquidity, intraday trading  
12      behavior, and transaction costs.

13                 For this study's purpose, we have defined  
14      retail as a market participant who is not registered as  
15      a commercial entity or other reportable participants who  
16      trades less than 50 contracts a day during this whole  
17      period. It is an interim report as our work is still  
18      ongoing.

19                 I am going to hand over to my colleague Gene,  
20      who will provide an introduction to these retail growth in  
21      futures markets. And I will pick it up after he  
22      completes the introduction.

1                   Over to you, Gene.

2                   MR. KUNDA: Thank you, Mel.

3                   As this first slide indicates, the daily  
4                   transaction volumes of U.S. futures and options across  
5                   all exchanges has increased dramatically during the past  
6                   14 years. The light blue columns in this graph  
7                   represent the daily futures transaction volumes. And  
8                   the red stacked column represents options volume.

9                   As you will note from the graph, historically,  
10                  as volatility, represented by the VIX, as the dotted  
11                  line on the graph indicates, would increase during  
12                  periods of market volatility. And, generally, in the  
13                  past, we saw the markets would become risk-averse,  
14                  leading to lower volumes. However, remarkably, in the  
15                  past 10 years, a noticeable change is seen where a  
16                  stronger correlation now exists between volatility and  
17                  volumes where daily trading volumes increased with  
18                  higher volatility.

19                  Next slide, please. This slide shows that the  
20                  number of new participants trading for the first time in  
21                  our markets peaked during the early pandemic months of  
22                  March 2020. Over 85,000 new participants traded in our

1 markets. As the graph indicates, the number of new  
2 participant names that we identified has seen a  
3 threefold increase since January 2020. We observed the  
4 increased order flow through retail FCMs and introducing  
5 brokers who offer easier market access, such as online  
6 account openings, reduced fees, and lower minimum  
7 balance requirements, to those that offer traditional  
8 brokerage accounts. We have also seen a rapid growth of  
9 smaller retail-friendly contracts brought to market by  
10 both existing and emerging new exchanges.

11 Next slide, please. Although we observed over  
12 750,000 unique new accounts traded since 2016, only  
13 around 375,000, or 50 percent, of these accounts traded  
14 more than once during the period of their life. We are  
15 still analyzing this information to ensure that this  
16 difference is not entirely attributed to FCMs setting up  
17 account names after an initial registration or after a  
18 first transaction. Though, regardless, this 375,000  
19 increase is still substantial.

20 The graph here on this slide represents the  
21 number of total participants, unique participants, each  
22 month in the futures markets. They include all of the

1           retail and other participants, including all of the  
2           market makers and professional traders, commercial, and  
3           asset managers.

4                 You can see from this graph the current  
5           monthly average of approximately 200,000 unique  
6           participants in the U.S. futures markets is a 75 percent  
7           increase in the number of futures market participants  
8           than just one year ago.

9                 This slide looks at the maximum participation  
10          level by retail traders in each of the futures contract  
11          markets. The dates above the columns indicate the  
12          highest level of retail activity in these contracts.  
13          And the percentage represents the highest participation  
14          level compared to the average participation level by  
15          retail accounts or participants in each contract between  
16          January 2020 and February 2021.

17                 As the graph indicates in silver, we observed  
18          three times the average participation in February this  
19          year. In the crude oil, WTI, contract, we observed  
20          nearly two and a half times the average participation  
21          level during January of 2020.

22                 When we further analyzed this data, several

1 trading behavioral patterns emerged. These are, one,  
2 retail participants don't typically trade regularly or  
3 uniformly. They appear to seek specific market  
4 opportunities. And, two, most retail traders are short-  
5 term traders. They are not like high-frequency traders  
6 seeking microsecond opportunities or hedgers with long-  
7 term positions. They tend to be dramatic and seek  
8 shorter-term trends. Almost 50 percent of these retail  
9 traders are day traders, meaning they don't carry  
10 overnight positions. And the other half of traders that  
11 do hold positions overnight are not seeking longer-term  
12 investments and tend to be seeking shorter-term  
13 opportunities.

14 Next slide, please. And this slide shows the  
15 impact of social media by taking a closer look at the  
16 volumes of retail trading in silver and crude oil. As a  
17 part of the analysis, we looked at the highest number of  
18 search activities on Google Trends during this period  
19 shown in the yellow line. And the blue column  
20 represents the retail position trades. And the red  
21 columns represent the retail day traders. It is  
22 fascinating to see the high correlation between the

1 increased participation and social media interest.

2 The Google search score on this slide is from  
3 public information made available by Google through its  
4 service Google Trends that analyzes the popularity of  
5 top search queries. Both February 1, 2021 for the  
6 silver market and April 20th, 2020 for the WTI contract  
7 recorded the maximum score, or a number of 100. The  
8 number represents the search interest relative to the  
9 chart's highest point for the selected region in time.

10 And the value of 100 is the term's peak popularity.

11 With that, I will turn it back over to Mel.

12 MR. GUNEWARDENA: Thank you, Gene.

13 The next slide looks deeper into the  
14 microstructure of derivatives markets by further analyzing  
15 those same crude oil and silver examples that Gene discussed.  
16 Gene's analysis explained the growth of retail accounts  
17 accessing futures markets directly. In this slide, we  
18 look at the asset managers, namely the exchange-traded  
19 funds or exchange-traded notes, that include commodity  
20 or financial references in their products and also in both  
21 the futures and derivatives markets.

1                   Our analysis observed that there are three  
2                   specific ways futures markets are affected by a sizeable  
3                   retail engagement in the securities markets,  
4                   particularly the ETFs or the ETNs. First, many  
5                   ETFs and ETN managers directly risk-manage using the  
6                   futures markets. As there may be exchange of ETF or ETN  
7                   terms required, these managers will directly add,  
8                   change, or reduce their futures positions. Two, ETF and  
9                   ETN managers and other asset managers who provide  
10                  retail-type products use swaps to hedge their exposure.

11                  And the swap dealer may hedge the residual exposure in  
12                  futures markets. And, three, ETF and ETN managers may  
13                  trade swap or cash markets. However, the cash in  
14                  futures markets could emerge, as you know. And in the  
15                  silver example, a significant amount of cross-market  
16                  arbitrage occurs and tangentially affect our markets  
17                  almost in real time.

18                  As you can see from this slide, the activity  
19                  associated with ETFs directly, indirectly, and  
20                  tangentially grew to the highest level during the same  
21                  periods where we saw direct retail activity affect  
22                  futures markets in the silver and crude oil example.

1                   Next slide, please. When we compare the  
2                   social media-fueled activities in equities to the futures  
3                   markets, there are several similarities, but there are  
4                   also some differences that we noted. These are, one,  
5                   the size of the physical commodity markets are  
6                   significantly larger than the typical small cap equity.  
7                   Two, the futures markets don't have a short-selling to  
8                   securities-borrowing concept. Futures markets have a  
9                   long and short open interest. Every buyer has a seller  
10                  on record. And, three, a difference that is critical is that  
11                  futures contracts do have an active contract with a  
12                  specific expiry date unlike any securities contracts.  
13                  When these active contracts reach expiry, noncommercial  
14                  participants will need to exit the market by selling or holding  
15                  their positions because they are unlikely to take or make  
16                  delivery.

17                  Next slide, please. In analyzing the bid-offer  
18                  spreads, order book depth, price scores and price  
19                  volatility in both crude oil and silver, which are  
20                  the largest examples in our markets. There were various  
21                  periods where there was reasonable bid-offer spreads  
22                  and order book depth. And there were also other periods

1 where there was deep dislocation in these markets.

2 When we looked and analyzed that deeply, we  
3 noticed that most retail activity that we observed are limit  
4 prices, which means that they are adding to liquidity,  
5 as opposed to taking liquidity. In most cases, retail  
6 appeared late into the market trend and typically held  
7 onto their positions until the end or a little bit late.

8 In silver, it is also noticeable that most silver prices  
9 occurred in the Asian open. And the significant inflows  
10 on February 1st into futures and ETFs mostly missed that  
11 move. In the WTI contract, the large retail  
12 participation exited late, mostly selling into or at  
13 the close where prices fell dramatically below zero.

14 Next slide, please. In this slide, we show  
15 the performance of the overall retail activity in the  
16 futures markets between January 2020 and February 2021.

17 That is a 14-month period. The horizontal line shows  
18 the level of participation, where further to the right,  
19 it will be the higher the participation levels, meaning  
20 the number of participants actively engaged in this  
21 market. The vertical axis shows the level of returns.

1       If it is above the horizontal axis, it indicates, overall  
2       as a portfolio, positive returns. And if it is below the  
3       horizontal line, it indicates a negative return. You  
4       will note from the bubbles that they are proportionately  
5       adjusted to indicate the relative return differences  
6       between each other.

7                   So, as this slide indicates, the overall  
8       retail performance across various types of traded asset  
9       classes in the futures and derivatives markets, which  
10      included U.S. Treasuries, equity indices, agriculture  
11      contracts, metals, energy contracts, currencies,  
12      livestock, and soft commodities, overall had a very weak  
13      retail return profile.

14                  In summary, we observed a visible growth of  
15       retail interest across derivatives markets, fueled by easier  
16       market access, both directly and indirectly; social media hype;  
17       smaller and retail-friendly contracts; and retail-friendly  
18       terms at new and existing exchanges. The potential economic outlook  
19       for commodity super cycles may further incentivize growth.

20                  As we stated, although the number of retail

1 participant accounts has grown exponentially, when you  
2 really look at the actual trade activity, the trade  
3 volumes are relatively small, between 10 to 15 percent  
4 of total activity.

5 The different trading behavior of retail  
6 traders to HFTs and other potential investment  
7 strategies definitely add to the diversification of  
8 liquidity derived from their participation.

9 Asset and money managers who offer retail  
10 products, like ETFs and ETNs, increase both the direct,  
11 indirect (via swaps), tangential, which is cross-market  
12 arbitrage, impact to derivatives markets.

13 We observe the retail trading will  
14 significantly influence our markets, even though  
15 physical commodity markets are much larger than the  
16 small-cap equities. As we saw from the crude oil contract in  
17 April, that even though the market is similar, the  
18 physical market is similar, it could be over two trillion  
19 in size, the futures markets were not immune to kind of an  
20 impact or at least having the retail participants get impacted  
21 due to an adverse price model.

1                   And, then, finally, our interim conclusions  
2                   -- and, obviously, as I mentioned, this is an ongoing  
3                   project -- that retail participation, both directly and  
4                   indirectly, is here to stay. The additional retail  
5                   interest provides diversification and liquidity to our  
6                   markets. However, if this sector is to develop fully, a  
7                   more even return profile is needed to emerge.

8                   Specifically, two areas that we discussed that everyone  
9                   has been discussing already, first, continuing the work  
10                  in developing investor protection, disclosures,  
11                  education, suitability standards, and establishing  
12                  unambiguous obligations on the FCMs and introducing  
13                  brokers to protect investor interest.

14                  And, two, it is equally important that we  
15                  further analyze the microstructure of our markets around  
16                  these trading venues, price discovery process, spreads,  
17                  price quotes, and liquidity, and specifically trading behavior  
18                  to understand how emerging trading strategies could be  
19                  predatory that would benefit unfairly to this increased retail  
20                  engagement and bring about policy recommendations, as well as  
21                  work closely with market participants, major market  
22                  participants, in ensuring fairness across our markets.

23                  That concludes this update. Chairman Karna,

1 back to you.

2 CHAIRPERSON KARNA: Thank you, Mr. Gunewardena  
3 and Mr. Kunda.

4 Our second panelist is Jonathan Lave,  
5 Associate Director in the CFTC's Division of Market  
6 Oversight. Mr. Lave will present on some of the CFTC's  
7 core principles for designated contract markets and  
8 their particular relevance to retail market  
9 participants.

10 Please go ahead.

11 MR. LAVE: Good morning. As was said, my name  
12 is Jonathan Lave. And I am an Associate Director in the  
13 Market Review Branch in the Division of Market  
14 Oversight. I have been asked to speak about certain of  
15 the CFTC's designated contract market core principles  
16 and their particular relevance to retail market  
17 participants.

18 Before I begin, let me make the usual  
19 disclaimer that the views expressed are mine and do not  
20 necessarily reflect the views of the Commodity Futures

1           Trading Commission, any of the Commissioners, the  
2           Division of Market Oversight, or other staff at the  
3           Commission.

4                 First slide, please. Thank you. So what is a  
5                 retail market participant? The Commodity Exchange Act  
6                 does not define the term "retail market participant,"  
7                 and there are no DCM regulations specifically directed at  
8                 a class of market participants known as retail market  
9                 participants. The Commodity Exchange Act, however, uses  
10                 the term "retail" in the context of retail commodity  
11                 transactions and retail forex customers. In both of  
12                 these contexts, retail refers to a counterparty or  
13                 customer that is not an eligible contract participant.

14                 Next slide. So, for purposes of discussion,  
15                 when I use the term "retail market participant," I am  
16                 referring to a market participant that is not an ECP.  
17                 But what is an ECP? An entity such as a financial  
18                 institution, insurance company, or commodity pool is  
19                 classified by the Commodity Exchange Act as an ECP based  
20                 upon its regulated status or amount of assets. This  
21                 classification permits these persons to engage in

1 transactions not generally available to non-eligible  
2 contract participants.

3 The specific guidelines for ECPs are spelled  
4 out in Section 1a(18) of the Commodity Exchange Act and  
5 Commission regulation 1.3. Generally, when we think of  
6 ECPs, we think of more sophisticated participants.

7 Next slide, please. So retail market  
8 participants are generally not members of an exchange or  
9 a clearinghouse. Instead, they use intermediaries like  
10 introducing brokers to access markets and futures  
11 commission merchants to clear trades. Retail market  
12 participants that use intermediaries are protected by  
13 provisions of the Commodity Exchange Act and Commission  
14 regulations that govern these intermediaries.

15 A discussion of these protections is outside  
16 the scope of this presentation. However, anyone  
17 interested in fully understanding retail market  
18 participant protections should familiarize themselves  
19 with these provisions.

20 Next slide. So because retail market  
21 participants are not ECPs, they are prohibited from  
22 trading on swap execution facilities. As such, in the

1       United States, trading occurs on designated contract  
2       markets. Designated contract markets have a number of  
3       core principles and regulations that may assist retail  
4       market trading and protect retail market participants.

5       Let's begin by looking at some of the ways they assist  
6       retail market trading.

7                  Next slide, please. One way the law assists  
8       retail market trading is by ensuring DCMs provide open  
9       access to members, persons with trading privileges, and  
10      independent software vendors. As a general matter,  
11      retail market participants are usually in the category  
12      of persons with trading privileges. Specifically, DCM  
13      core principle 2 and Commission regulation 38.151  
14      require DCMs to establish, monitor, and ensure  
15      compliance with rules to provide open access. Under  
16      these provisions, a DCM's access rule should be based on  
17      the financial and operational soundness of a participant  
18      and not on factors that could bar access and result in  
19      discriminatory access or act as a barrier to entry.

20                 A DCM must set nondiscriminatory fee classes  
21      for those receiving access to the DCM. And a DCM must  
22      establish and impartially enforce rules governing any

1           decision by the DCM to deny, suspend, or permanently bar  
2           a member's or market participant's access to the  
3           contract market.

4                         Next slide, please. DCM core principle 8 and  
5                         Commission regulations, like 16.01, assist retail  
6                         market trading by requiring DCMs to make certain  
7                         information public and specify that certain information  
8                         must be provided free of charge. These provisions  
9                         ensure that retail market participants have access to  
10                         market information about settlement prices, volume, open  
11                         interest, and opening and closing ranges for actively  
12                         traded contracts in the contract market, information to  
13                         which they might not otherwise have access. This  
14                         information allows retail market participants to make  
15                         well-informed investment decisions. In addition, well-  
16                         functioning markets depend on well-informed participants.

17                         Next slide, please. DCM core principle 9  
18                         requires that DCMs provide a competitive, open, and  
19                         efficient market and mechanism for executing  
20                         transactions that protects the price discovery process  
21                         of trading in the centralized market of the board of

1 trade. To qualify as a board of trade, the market must  
2 be an electronic trading facility, as that term is  
3 defined in 1a(16) of the Act; or a trading facility, as  
4 that term is defined in section 1a(51) of the Act.

5 Next slide, please. So I will now turn to DCM  
6 protections of retail market participants by focusing on  
7 the protections of participants that use intermediaries.  
8 DCM core principle 2 requires DCMs to establish,  
9 monitor, and enforce rules prohibiting abusive trade  
10 practices. Under Commission regulation 38.152, DCMs  
11 that permit intermediation must prohibit customer-  
12 related abuses, including, but not limited to, trading ahead  
13 of customer orders, trading against customer orders,  
14 accommodation trading, and improper cross trading.

15 Next slide, please. Similarly, core principle  
16 12 requires that DCMs establish and enforce rules to  
17 protect markets and market participants from abusive  
18 practices committed by any party, including abusive  
19 practices committed by a party acting as an agent for a  
20 participant; and to promote fair and equitable trading  
21 on the contract market. Commission Regulation 38.651

1       requires DCMs to have and enforce rules that are  
2       designed to promote fair and equitable trading and to  
3       protect the market and market participants from abusive  
4       practices, including fraudulent, noncompetitive, or  
5       unfair actions committed by any party.

6                  Next slide, please. So, as we noted, retail  
7       market participants tend to use intermediaries, like  
8       introducing brokers and futures commission merchants, to  
9       trade and clear trades. DCM core principle 11 requires  
10      DCMs to establish and enforce rules and procedures for  
11      ensuring the financial integrity of transactions entered  
12      into on or through the DCM and to ensure the financial  
13      integrity of any futures commission merchant or introducing  
14      broker and to ensure the protection of customer funds.

15                 Next slide, please. A number of regulations  
16      set forth requirements for complying with core principle 11.  
17      Commission Regulation 36.603 requires DCMs to have rules that  
18      protect customer funds. Commission Regulation 38.604 requires  
19      DCMs to monitor members' compliance with the DCM's minimum  
20      financial standards.

21                 This includes a requirement to continually survey the  
22      obligations of each futures commission merchant created

1 by the positions of its customers and take appropriate  
2 steps to use this information to protect customer funds.

3 Next slide, please. Commission Regulation  
4 38.605 requires a DCM's financial surveillance program  
5 to comply with Commission Regulation 1.52.

6 And, finally, Commission regulation 38.607  
7 regulates direct access by FCM customers. That is, where  
8 FCMs allow their customers to enter orders directly into  
9 a DCM's trade-matching system for execution. The rule  
10 requires that DCMs have in place effective systems and  
11 controls reasonably designed to facilitate the futures  
12 commission merchant's management of financial risk, such  
13 as automated pre-trade controls that enable member FCMs to  
14 implement appropriate financial risk limits.

15 That's what I have to say. Thank you.

16 CHAIRPERSON KARNA: Thank you, Mr. Lave.

17 Our final panelist for panel 1 is Alison Beer,  
18 Senior Legal Counsel, Derivatives Branch, at the Ontario  
19 Securities Commission.

20 Please go ahead, Ms. Beer.

21 MS. BEER: Thank you. First, I just want to

1 confirm that you are able to hear me.

2 CHAIRPERSON KARNA: We can. Thank you, Ms.

3 Beer.

4 MS. BEER: Great. I want to thank the CFTC  
5 Commissioners; CFTC staff; in particular, Commissioner  
6 Stump; and Andrée Goldsmith for the honor of being  
7 invited to speak at today's GMAC meeting and for the  
8 opportunity to share a Canadian perspective on retail  
9 investors' participation in derivatives markets.

10 Next slide, please. The views expressed in  
11 this presentation are my personal views and do not  
12 necessarily represent the views of the Ontario  
13 Securities Commission, the Commissioners, or of  
14 Commission staff.

15 Next slide, please. In the short time that we  
16 have together this morning, I am going to provide,  
17 first, an overview of the regulatory framework for  
18 retail derivatives trading in Ontario. Next, I will  
19 share some of the comparative insights we have regarding  
20 the retail derivatives market and recent trading  
21 volatility linked to the retail-led meme trading. And,  
22 finally, I will highlight some of the developments with

1 respect to the products retail investors can trade in  
2 Ontario that gives them exposure to crypto assets on a  
3 regulated basis.

4 Next slide, please. As a regulatory agency,  
5 the OSC oversees retail derivatives trading by  
6 administering and enforcing the Ontario Securities Act  
7 as well as the Commodity Futures Act. And it is through  
8 a combination of these two statutes that the OSC derives  
9 its jurisdiction over the securities and derivatives markets.  
10 Similar to the U.S. framework, under the oversight of  
11 the OSC, we have exchanges and other SROs that are  
12 responsible for certain aspects of the regulation of  
13 market viewers and advisors. And for IIROC, which is  
14 essentially the equivalent of FINRA and the NFA, this  
15 includes, among other things, along with OSC oversight,  
16 responsibility for examining the qualifications of  
17 proficiency of the dealers and advisers; establishing  
18 technical criteria relating to the financial integrity  
19 of its members, including capital requirements and  
20 margin requirements; as well as conduct-oriented  
21 oversight relating to retail sales practices as well as  
22 product and

1 client relationship disclosure.

2 For those of you who are familiar with the  
3 Canadian landscape, either on the regulatory side or  
4 because you do business in Canadian markets and you are  
5 looking at the screen, you will be aware that while all  
6 of this looks very straightforward, in practice, it is  
7 not. We essentially need to multiply this slide by 13  
8 to represent all of the independent regional regulators  
9 who together oversee securities and derivatives markets  
10 in Canada.

11 And one thing I should also add is that our  
12 concept of what constitutes a retail market participant  
13 is somewhat similar to the CFTC's concept, at least as it  
14 relates to derivatives. And so it is through this entire  
15 framework that retail investors can use an intermediary to  
16 trade a variety of exchange-traded products as well as  
17 OTC derivatives.

18 Next slide, please. In Ontario, we have  
19 similarly witnessed an evolution over the last decade in  
20 retail market participation. And there has certainly  
21 been a significant rise during this period in the number

1       of online trading platforms that offer derivatives  
2       products to retail investors.

3                  A few of the interesting features that  
4       distinguish the Ontario market from the U.S. market  
5       currently relate to certain product offerings. So, for  
6       example, retail investors can trade contracts for  
7       difference, which are leveraged over the-counter products  
8       that allow them to speculate on the future direction of  
9       a market's price without taking ownership of the  
10      underlying asset. And they can do so through a regulated  
11      dealer on a large universe of underliers, which  
12      includes oil, currencies, stock indices, the VIX,  
13      commodities, as well as single-name securities, like we had  
14      seen in BlackBerry.

15                  Individual retail investors, however, cannot  
16      trade contracts that are structured as binary options.  
17      So those are the contracts that are structured as a  
18      simple yes or no bet on how the cost of an asset will  
19      finish at the close of the contract. A prohibition was  
20      introduced in Ontario a few years ago and several other  
21      CSA jurisdictions on the offering of these products to

1           retail individual investors, largely as a result of the  
2           sheer magnitude of fraud that was occurring during that  
3           period.

4                 In terms of other differences, we thought it  
5           was important to note that there is a much greater  
6           degree of consolidation in our markets. So the retail  
7           dealer space is relatively consolidated for exchange-  
8           traded derivatives products. And for the most part,  
9           these brokerages are owned by the large Canadian banks;  
10           whereas, the Canadian bank-owned dealers are not active  
11           in the retail over-the-counter space. And in that  
12           space, there are almost a dozen independent dealers  
13           offering the OTC products at the retail level.

14                 In terms of this past year in particular, as Mel  
15           and Gene from the Market Intelligence Branch indicated in  
16           their presentation, we have also, similarly, seen  
17           significant acceleration in the number of retail investors,  
18           primarily a much younger demographic, that are opening  
19           trading accounts for the very first time. What is  
20           interesting and although not surprising is how this cohort  
21           accesses the information, and how they are coordinating  
22           their actions. Plus, they bring in such large numbers.

1                   Next slide, please. Obviously the internet  
2        has had trading chatrooms for decades at this point, but  
3        until recently, we certainly haven't witnessed this  
4        exact type of trading monoculture that is amplified  
5        through social media. And Subreddits like WallStreetBets  
6        and its Canadian parallel, BayStreetBets. And some of the  
7        research that our investor office has done sort of talked a  
8        lot about these new trends.

9                   While much of the meme-driven trading activity  
10      occurred in securities that are listed in the U.S.,  
11      there were a small number of Canadian-listed securities  
12      that saw notable price increases towards the end of  
13      January and early February. That included BlackBerry  
14      Limited, which is inter-listed on the New York Stock  
15      Exchange and trades in Canada on the TSX. So we thought  
16      that would be an interesting example to have a closer  
17      look at.

18                   Next slide, please. Now, if you look at the  
19      figures on the graph and you look at the line graph, the  
20      blue, the color blue, represents the activity on  
21      Canadian exchanges. And the orange represents the

1 activity on U.S. exchanges. You will see that both  
2 countries where BlackBerry is listed show similar  
3 characteristics in the sense that there is a spike in  
4 the trading volume in late January and early February,  
5 but this spike is so much larger in the U.S. During  
6 normal times, there is much more activity in the States,  
7 but during this relevant period, trading volumes grew  
8 exponentially larger in the U.S. And the visual  
9 differences don't tell the whole story because you will  
10 note on the top graph, relating to the stock trading  
11 volume, there is one legend and one scale. If you look  
12 below on the options graph, we had to use different  
13 scales. That is how significant the difference in the  
14 volume is.

15 At the very peak, options trading volumes in  
16 the U.S. hit around one million contracts. Our peak  
17 trading volumes didn't even cross 20,000 contracts.  
18 If you actually put those charts together on the same  
19 graph and used the same scale, you wouldn't see the  
20 Canadian line.

21 So what does that mean? Well, one take on  
22 this could be that retail-driven trading activity based

1       on the meme stock phenomenon is mainly a U.S. phenomenon.  
2       However, another way to look at it is that in North  
3       America or beyond, what it could mean is that this type  
4       of trading, this short-term trading, attracts people  
5       looking for liquidity, both in the stock itself, and it  
6       is a similar story for options. And the liquidity that  
7       was to be had really is found in U.S. markets, not  
8       Canadian markets. And since Canadian investors can  
9       trade equities futures and options in U.S. markets, and that  
10      includes retail investors, any added Ontario retail  
11      investor activities primarily took place on U.S.  
12      exchanges and, therefore, instead may be reflected in  
13      U.S. trading volumes. And I think what this story tells  
14      us from an Ontario perspective is just how integrated  
15      our investors are to the markets and not beating on  
16      Canadian stocks that happen to be inter-listed, right?  
17      Almost all of the relevant trading activity that takes  
18      place takes place on U.S.-based exchanges.

19                          Next slide, please. So this graph relates to  
20      the trading volumes in contracts for difference. You  
21      could see, similarly, a spike in late January and early  
22      February. If you look at the commodities line, which is

1 where equities are captured in our data, even though  
2 it's a little flatter than we expected, there was a  
3 sixty percent increase in trading volume. There was a  
4 60,000-contract rise in a very short period of time that  
5 correlated to the period when we saw similar spikes in both  
6 the equities and options markets. We did find some  
7 underliers involving GameStop, BlackBerry, and the other  
8 meme stocks, but otherwise, there is not too much to  
9 tell here other than these are fairly mainstream retail  
10 products that allow Ontario investors to get exposure to  
11 the market without having to hold the actual stock.

12 Next slide, please. Any discussion about  
13 retail trading would be incomplete without talking about  
14 their appetite for products that give them exposure to  
15 cryptocurrencies. In Ontario, retail investors can  
16 currently trade the following products on a regulated  
17 basis: bitcoin and ether-linked futures contracts and  
18 bitcoin options on certain U.S.-based exchanges through  
19 registered dealers, investment funds offering exposure  
20 to bitcoin and ether and ETFs linked to bitcoin. And,  
21 just as a reflection of how quickly this space is

1 moving, I submitted my slides two days ago, and the  
2 second bullet is already out of date. It's more than  
3 one ETF linked to bitcoin. There are now two, and  
4 potentially more on the way.

5 And then the third one relates to crypto  
6 rights contracts that are linked to bitcoin and ether.  
7 And so far, there is one registered dealer that's registered  
8 in the category of a restricted dealer, subject to a host  
9 of terms and conditions, including investment limits,  
10 that can offer bitcoin and ether contracts to Ontario  
11 retail investors.

12 Next slide, please. With respect to crypto  
13 rights contracts and crypto asset trading platforms, in  
14 2019, the OSC, along with the rest of the CSA, consulted  
15 on a proposed framework to regulate crypto asset  
16 trading. In 2020, the CSA issued guidance, which  
17 explained that platforms that facilitate the buying and  
18 selling of crypto assets, including crypto assets that  
19 are more closely analogized to commodities, fall within  
20 the Commission's jurisdiction when the crypto asset is

1           not delivered. And that is because the users' contractual  
2           rights to the crypto asset itself constitutes a security  
3           and/or a derivative.

4                 Though there is certainly a lot of similarity  
5                 in our guidance to the CFTC's final interpretive  
6                 guidance concerning retail commodity transactions that  
7                 involve digital currencies, however, there is a noteworthy  
8                 distinction. And that is that the transactions do not need  
9                 to involve leverage in margins to engage the CSA's  
10                 jurisdiction and otherwise require platforms that are offering  
11                 these products to be registered as dealers. And, as a result,  
12                 there are cryptocurrency exchanges that might consider themselves  
13                 as thought exchanges or facilitating cash market transactions  
14                 whose activities would fall within the parameters of the  
15                 guidance and that we may expect to be registered as dealers with  
16                 the OSC to the extent they are offering those services to  
17                 Ontario customers.

18                 With respect to the crypto asset trading  
19                 platforms, I think it is fair to say there is more to  
20                 come from us as regulators and that we're building

1       this bridge as we cross it. It raises lots of  
2       interesting issues relating to custody, how one can  
3       properly safeguard customer assets, as well as  
4       interesting developments that we are following closely,  
5       including in the U.S., with respect to product  
6       classification, so lots to come on that front. And,  
7       again, as I mentioned, we are certainly watching very  
8       closely both the SEC's and the CFTC's developments in  
9       this space.

10                  Next slide. That was the last slide in my  
11          presentation. And, with that, I would like to thank you  
12          again for inviting me to contribute to today's  
13          discussion. Thanks very much.

14                  CHAIRPERSON KARNA: Thank you, Ms. Beer.

15                  The floor is now open for questions and  
16          comments on all of the presentations we have heard  
17          today. As a reminder, please use the WebEx chat icon  
18          and select all panelists in order to indicate that you  
19          have a question or a comment. I will then call on you.  
20          Mr. Corcoran? Mr. Corcoran, I believe you have a  
21          comment. Please go ahead. Mr. Corcoran, you may need  
22          to unmute yourself.

1 Andrée, I think we may be having some  
2 technical difficulties with Mr. Corcoran's line.  
3 Perhaps we could reach out to him separately and address  
4 that. In the meantime, does anybody else have any  
5 questions or comments on these presentations?

6 MR. SEXTON: Chair Karna?

7 CHAIRPERSON KARNA: Yes? Mr. Corcoran, are  
8 you available?

9 MR. SEXTON: Chair Karna?

10 CHAIRPERSON KARNA: Yes?

11 MR. SEXTON: This is Tom Sexton. I have just  
12 a comment while you are working on Mr. Corcoran's audio  
13 if that's okay.

14 CHAIRPERSON KARNA: Yes. Please go ahead, Mr.  
15 Sexton.

16 MR. SEXTON: Thank you. And I certainly want  
17 to thank the panelists for their very informative  
18 presentations.

19 As I said, this is more by way of a comment  
20 than a question for the panelists. And I know it was  
21 touched upon by our panelists: the importance of  
22 education. And education in our view is a very

1       important cornerstone of customer protection, particularly  
2       when we are talking about retail participants, government  
3       regulators, SROs, the exchanges, industry trade associations.  
4       And registrants can and do assist with educational efforts  
5       to the point of regulators taking the lead on education.

6                 I would certainly note that the sponsor of  
7       this committee, Commissioner Stump, wrote an excellent  
8       op-ed in Monday's Roll Call explaining the risk  
9       management importance of the derivatives markets. This  
10      article referencing her children and their friends was  
11      creative, was written with humor, and was straightforward  
12      in explaining the real-world utility of derivatives  
13      through, of all things, hamburgers, which I think we can  
14      all relate to.

15                 So to the point of other types of resources,  
16       look, many market users and potential market users need  
17       this type of simple and straightforward education to  
18       help them understand the markets, their products, the  
19       type of market participants, and certainly the  
20       regulatory protections that are available to them. And  
21       I wanted to take this opportunity to bring to the

1       attention of this committee and today's meeting  
2       participants an excellent educational online resource  
3       that delivers this type of simple and straightforward  
4       educational content and particularly designed for those  
5       that are new to our markets. And the name of this  
6       resource is Futures Fundamentals. It is an industry-  
7       wide initiative, and it is designed as a one-stop  
8       educational resource. Futures Fundamentals educational  
9       resources are many and diverse, including educational  
10      packages that instructors can use to deliver engaging  
11      content to their students. It has an interactive  
12      website. It is open to all. The website breaks down  
13      the very complexity of the topics and explains the role  
14      of the futures markets in everyday life, various  
15      participants in the marketplace, and the basics of how  
16      market participants can use futures and options.

17             This resource continues to evolve. And I will  
18      note that and certainly want to thank the CFTC staff for  
19      working with us recently to include more content  
20      regarding the importance of well-regulated markets and  
21      investor protection.

22             The basic point I am trying to make is I

1 encourage everyone to explore this resource and pass it  
2 on to others who would benefit from understanding or  
3 teaching others about our markets and their regulatory  
4 protections. You can find the resource and the site by  
5 going to futuresfundamentals.org. In our view, Futures  
6 Fundamentals is just another key initiative and an  
7 extremely beneficial resource and an important tool for  
8 education and customer protection, particularly as it  
9 relates to those that are unfamiliar with our markets  
10 and potentially retail investors.

11 So that's the point I wanted to make. It was  
12 more of a comment. And I thank you for allowing me to  
13 do so.

14 CHAIRPERSON KARNA: Thank you very much, Mr.  
15 Sexton.

16 Mr. Corcoran, do you have a comment?

17 MR. CORCORAN: I am here. Can you hear me?

18 CHAIRPERSON KARNA: Yes, we can. Thank you  
19 very much.

20 MR. CORCORAN: Thanks, everybody, for your  
21 patience on the little technical issue I had here. So  
22 first, let me -- for background purposes for everyone, I

1 am the CEO of R.J. O'Brien & Associates. And we have  
2 been around a long, long time. And through a very  
3 diverse client base, we serve farmers and ranchers. We  
4 serve fixed-income institutions, energy interests. We  
5 have a very large introducing broker network. And we  
6 serve the retail client base on a widespread basis.

7 First, I would like to commend the report  
8 presented earlier by the CFTC Market Intelligence  
9 Branch. Very, very informative and probably apropos for  
10 the time we are in today.

11 Retail participation in the futures markets  
12 has always been both substantial and important. And  
13 that is key, importance, to the success of the futures  
14 markets. Retail participation provides important  
15 elements, the price discovery mechanism, along with the  
16 liquidity that futures market participants provide the  
17 markets. Both very, very important.

18 I think it is also important to take a look  
19 back in history related to retail futures market  
20 participants. Almost since the onset of the National  
21 Futures Association, which I am on the board, they have  
22 been the champions of retail participants' interests.

1        You could go back and look at history. And they have  
2        cleared out the options trap houses. They cleared out  
3        the churning schemes and even Ponzi schemes. And then  
4        in the late '90s, they also cleaned up the retail forex  
5        fraudsters. And that job is never complete. As retail  
6        participants join the industry and if we are having  
7        retail participants join at an accelerated pace,  
8        protecting retail customers will always be an  
9        omnipresent process. So I really commend the topic we  
10      have here today.

11            But I would also like to say that FCMs and  
12      other intermediaries, such as IBs, have for a long time  
13      and continue to take important steps to protect retail  
14      customers. This may even include, you know, the  
15      regulatory mandated steps as requiring risk disclosure  
16      documents to be executed by customers. Other ways  
17      include retail education, as Tom just mentioned. FCMs  
18      and IBs pay attention to excessive trading; the churning  
19      risk; trading within margin parameters; blocking retail  
20      customers from trading in illiquid markets, including  
21      crypto products, until those markets develop. Many  
22      times, the intermediaries require the retail customers

1 to exit before delivery dates and in some cases, the  
2 block on trading of naked short options, which in many,  
3 many cases, the retail customer is too naive to  
4 understand the risks associated with naked short  
5 options.

6 So we have a situation that has evolved, I  
7 think, in industry with less fraud but more need for  
8 education because of the risk of the markets. It is  
9 important to know that futures markets themselves are  
10 highly leveraged markets. And retail customers that may  
11 be migrating from trading stocks and moving into retail  
12 futures products don't understand the risks that are  
13 associated with them.

14 A great example of that was what happened with  
15 the CME WTI crude contract earlier this year that  
16 everyone is very well-familiar with, that went negative  
17 on price. No one ever thought that could happen, and it  
18 did. Well, what did the intermediaries do? For the  
19 most part, I would say all of the intermediaries blocked  
20 retail participation in front-lumped WTI products until,  
21 you know, the market came back to a stabilization  
22 factor. So intermediaries play a critical role in

1           protecting retail customers, and they do it in real  
2       time. Okay? And so this is really an interesting  
3       process that is taking on. This has been going on for  
4       years for intermediaries taking these types of steps.

5                   So I am just going to wrap up my comments.  
6       And, you know, I concur with the conclusions in the  
7       report, but I also would reinforce that substantial  
8       protections are already in place for the retail  
9       participants. Intermediaries, along with the NFA,  
10      really remain vigilant in addressing and protecting the  
11      retail participation.

12                  That concludes my thoughts and comments.  
13      Thank you for letting me make these comments. And I  
14      will turn the call back to Andrée.

15                  CHAIRPERSON KARNA: Thank you very much, Mr.  
16      Corcoran.

17                  Mr. Cutinho?  
18      MR. CUTINHO: Hi. Can you hear me?  
19      CHAIRPERSON KARNA: Yes, we can. Thank you,  
20      Mr. Cutinho.

21                  MR. CUTINHO: Excellent. So I will compliment  
22      Mr. Corcoran's views. Very quickly, I echo Gerry's

1 comments. You know, thank you to the presenters, very  
2 informative presentation. But I wish to compliment  
3 based on what the exchanges have in terms of protections  
4 and the general structure.

5 So Gerry touched upon the, you know, education,  
6 risk protections. So from the exchanges' perspective,  
7 you know, we provide risk tools to our members to  
8 control exposures at the order level prior to execution.  
9 They are both at a product level and then at an account  
10 level. So this allows market participants and even our  
11 members to control risks. This is not necessarily true  
12 in all cases in the securities markets because execution  
13 can take place away from exchanges. And they can take  
14 place in pools of liquidity. So it is an important  
15 distinction to keep in mind.

16 The second is, you know, there are -- as the  
17 Commission presented, there are a lot of protections for  
18 customers. In addition to that, from an exposure  
19 perspective, you know, the Commissioners put in place  
20 gross margining requirements. Why is that relevant in  
21 this case? In addition to gross margining, our members  
22 or FCMs are required to collect from their customers

1 margin, you know. So this is an important aspect of  
2 protection because, you know, once customers take  
3 positions, whether they are retail or non-retail, their  
4 margin increases. So the more directional they are, the  
5 more the margins increase. So it acts as a dampener in  
6 many ways to their desire to actually increase their  
7 exposures.

8 At the same time, because we have customer  
9 protections all the way to the exchange and the  
10 clearinghouse, our members can actually pass on that  
11 margin all the way to the CCP so they don't end up in  
12 the liquidity situation where they are forced to finance  
13 their clients' exposures until settlement.

14 And, lastly, I would say we need to be very  
15 careful when we draw connections or causal relationships  
16 between social media and market events. You know, it is  
17 very hard to know if the market events are driving  
18 social media interest or social media interest is  
19 driving market activity.

20 As far as CME is concerned, we have a team  
21 that is monitoring social media. We actually like the  
22 transparency because it gives us information. And we

1       use that information for risk management purposes. So  
2       if it is a counterparty that is in the social media or a  
3       specific product, it is of great value for risk managers  
4       and not just for an exchange. It should be true, even  
5       for our clearing members.

6                   So, with that, I yield my time. thank you.

7                   CHAIRPERSON KARNA: Thank you very much, Mr.  
8                   Cutinho.

9                   All three of our comments so far have done an  
10          excellent job of highlighting existing protections that  
11          are in place and including educational resources that  
12          are available to retail market participants. Our  
13          panelists presented very interesting data about retail  
14          market participation and how that has increased  
15          substantially in recent time. So a question for all of  
16          our panelists as well as our GMAC participants, what  
17          changes, if any, should be considered from a policy  
18          perspective to ensure that derivatives markets are  
19          better suited to cater to these new retail market  
20          participants?

21                   As a reminder, if anyone has any thoughts,  
22          please just highlight that you have some feedback in the

1           WebEx chat function.

2           MR. GUNEWARDENA: Chairman Karna, it's Mel  
3         here. If I may just respond to your question briefly if  
4         that's okay?

5           CHAIRPERSON KARNA: Yes. Yes. That would be  
6         perfect. Thank you very much.

7           MR. GUNEWARDENA: I think in our analysis, one  
8         of the areas that we have to do a lot more work -- and I  
9         am not necessarily saying there is policy that can be  
10        clearly defined -- is really around the indirect  
11        influence in derivatives markets through intermediaries  
12        and how that can potentially affect market conditions.

13           So, as I mentioned, we analyze those  
14        participants who directly access futures markets at  
15        a retail level. We also analyze those that traded in  
16        other retail products and those managers, both in the  
17        U.S. and internationally, kind of use other markets in  
18        the U.S. to hedge. And we have been looking at this,  
19        obviously both kind of where we have seen kind of  
20        increased retail participation, like in the silver and WTI  
21        and

1           in other market moves.

2                 And I think we have a lot of work to do there,  
3                 and I think while our focus and discussion here is  
4                 around retail education and protections, which I  
5                 completely support and agree and I think they are very  
6                 important, the effects of the microstructure of the  
7                 markets through intermediaries in that translation needs  
8                 to also be talked through. And there is a lot of work  
9                 out there.

10                 It's just my thoughts.

11                 CHAIRPERSON KARNA: Great. Thank you very  
12                 much, Mr. Gunewardena.

13                 Does anyone else have any questions or  
14                 comments for our panelists or on this very timely topic?  
15                 Mr. Cutinho?

16                 MR. CUTINHO: Thank you for giving me the  
17                 floor. I think silver markets were mentioned a couple  
18                 of times. So I will give a risk manager's perspective.

19                 As far as the activity in silver markets were  
20                 concerned and the price moves were concerned, as the  
21                 Commission has pointed out, the retail participants'  
22                 activities were, you know, not as material as

1       institutional participants. You know, as far as their  
2       entry in the market is concerned, you know, as you can  
3       see from the graphs that the Commission presented, the  
4       moves were not driven by retail market participation but  
5       mostly institutional participants.

6                  It is also important to note that we  
7       focus our activity, focus our attention on  
8       market activity during this period, but the moves in  
9       silver were of similar nature to just six months back, so  
10      the October-November timeframe of 2020. So it's not  
11      easy to discern if these moves are the result of  
12      greater interest in silver or it is as a result of  
13      macroeconomic environment.

14                 So the Commission did point out about a  
15      commodity super cycle. Some of our market participants  
16      are talking about it. Commodities in general have been  
17      quite volatile. And this is not unique to silver. This  
18      is true of even our ag products. So it is important to  
19      actually, you know, not draw any causal relationships  
20      between the activity in silver markets and the moves in  
21      silver markets to retail participants.

22                 CHAIRPERSON KARNA: Thank you very much, Mr.

1           Cutinho.

2           We will now move on to the second agenda item  
3           for this morning, which is a series of presentations on  
4           the impact of the coronavirus pandemic on global  
5           clearing. We will start with a presentation from Pedro  
6           Gurrola-Perez, Head of Research at the World Federation  
7           of Exchanges.

8           Please go ahead, Mr. Gurrola-Perez.

9           MS. GOLDSMITH: Angie, this is Andrée. We are  
10          a little bit ahead of schedule. I think it might make  
11          sense if everyone is okay to take about a 10-minute  
12          break and resume back just after 10:30. Does that make  
13          sense?

14           CHAIRPERSON KARNA: Yes. Sounds perfect.

15          Thank you.

16           MS. GOLDSMITH: Great.

17          So everyone please  
18          remember to mute your lines while we are on break. And  
19          we will resume just after 10:30. Thank you.

20           (Recess taken.)

21           MS. GOLDSMITH: Hi, everyone. Welcome back.  
22          This is Andrée. I am just going to do a quick

1 attendance update for the GMAC members just to note a  
2 few GMAC members we did not hear earlier during the roll  
3 call. So present today on the call are Ted Backer from  
4 Morgan Stanley; Gerry Corcoran, whom we heard earlier,  
5 from R.J. O'Brien and Associates; and Adam Kansler from  
6 IHS Markit.

7 And, with that, I am going to turn it over to  
8 Angie to start panel 2. Thank you.

9 CHAIRPERSON KARNA: Thank you, Andrée.

10 We will now move on to the second agenda item  
11 for this morning, which is a series of presentations on  
12 the impact of the coronavirus pandemic on global  
13 clearing. We will start with a presentation from Pedro  
14 Gurrola-Perez, Head of Research at the World Federation  
15 of Exchanges.

16 Please go ahead, Mr. Gurrola-Perez.

17 MR. GURROLA-PEREZ: Thank you very much. I  
18 hope you can hear me.

19 CHAIRPERSON KARNA: Yes, we can. Thank you.

20 MR. GURROLA-PEREZ: Thank you. Thank you,  
21 Commissioners and the CFTC, for the opportunity to present  
22 our research work on procyclicality.

1                   Can we move to the next slide, please? And to  
2                   the next one. Let me start by saying that this research  
3                   originated when, despite the fact that CCPs have  
4                   different procyclicality mitigation tools and measures  
5                   in place, after the March events, we saw renewed and  
6                   sometimes incorrect claims about the procyclicality of  
7                   initial margin models. So the purpose of the research  
8                   was to show why the focus on initial margin is misplaced.

9                   Can we move to the next one, please? There  
10                  are five main reasons. First of all, we all know margin  
11                  requirements are driven by variation margin, not initial  
12                  margin. And they also depend on changes in the portfolio.

13                  I want to focus on four other points. First  
14                  of all, there are unavoidable tradeoffs and constraints.  
15                  Trying to reduce the impact on liquidity in the system  
16                  to the calibration of CCPs' initial margin models has the  
17                  obvious limitation that market risk models, irrespective of  
18                  whether they are used for central clearing, bilateral clearing,  
19                  or the banking sector, cannot simply ignore changes in market  
20                  conditions. In addition to that, central clearing needs  
21                  to be kept economically viable.

22                  Then we have randomness, which means that the  
23                  same calibration may produce different outcomes under

1 different initial conditions. So prescribing  
2 calibrations does not always guarantee the outcome. And  
3 we will see an example of this.

4 We also face what I think is a change. We  
5 need to distinguish between long-term properties, which,  
6 for example, extending the lookback period may be  
7 useful, from those needed to model market conditions at  
8 a specific point in time.

9 And, finally, the problem is that feedback  
10 loops are amplified through system interactions. We  
11 should look for solutions that address system-wide  
12 robustness. This calls for a complex systems approach,  
13 rather than a narrow reductive approach.

14 Next slide, please. So we will illustrate  
15 these points. We are going to give an example.  
16 What we will do is show how these limitations played out with  
17 the March 2020 stress. We will consider Standard and Poor's  
18 500 portfolio for the prices, 15 years of prices. And  
19 we will consider some typical CCP risk models. They do  
20 not reflect any individual CCP. They are sufficiently  
21 representative to capture the nature of the problem.

22 In particular, I will be presenting results  
23 using a filtered historical simulation, value at risk.

1 These are models -- the idea behind them is to give more  
2 weight to recent observations to allow for sensitivity to  
3 changes in volatility. Calibration is quite standard:  
4 market period of one day, lookback period of 1, 10, or  
5 12 years, and confidence level of 99 percent.

6 Next slide, please. So, first of all, to set  
7 the scene, let me show you an estimation of volatility  
8 through the periods. So two things to highlight here:  
9 first, volatility changes a lot. It changes in clusters.  
10 This is why risk models need to be sensitive to short-term  
11 changes in market conditions. And it is easy to forget this  
12 difference. Like sometimes here and sometimes it's out of  
13 that -- they were too many breaches in March. And this will  
14 get the fact that the number of breaches is a long-term  
15 statistic. And it knows how volatility clusters.

16 Another thing that I want to point out from  
17 this is that the spike that we observed in March 2020,  
18 which was a maximum, which is 6.5 times larger than the  
19 long-term volatility. So this is something we probably  
20 should bear in mind when assessing model procyclicality.

21 Next slide, please. Because of the tradeoffs  
22 involved, any discussions about procyclicality should take  
23 into account the impact on costs and on coverage. So to

1 assess the models, what we did is to use some standard  
2 measures of coverage and of procyclicality. And we also  
3 introduced a measure of the cost of over-margining.

4 So next slide, please. Let's look at the  
5 performance of these models using different lookback  
6 criteria, that is, the different risk sensitivities. We can  
7 see just looking at the graph that the more reactive model  
8 is the filtered historical simulation model with one-year  
9 lookback. This is the line, the highest line, the one that -  
10 I think it is in red.

11 After that, we have the same filtered historical  
12 simulation, but we have 10-year lookback period. Clearly it  
13 is less sensitive. The 12-year lookback period is very  
14 similar to the 10-year. So it is difficult to distinguish.  
15 And the dotted line, we see is a basic non-filtered 10-year  
16 historical simulation VaR.

17 So we have three models with different risk  
18 sensitivities, all of them reacting to a different extent, to  
19 the change in volatility that we saw in March. If we look  
20 at the statistics on the right-hand side, you see that,  
21 as expected, among the filtered models, the 10 year is  
22 less procyclical but produces, of course, larger  
23 breaches. This is a very simple example, and it is just

1 to illustrate why asking for lower procyclicality and at  
2 the same time for less or smaller breaches is to be a  
3 contradictory request.

4 Now, is it true that increasing a period of stress  
5 guarantees an improvement to the model's procyclical behavior?

6 Well, not in this case. The 10-and the 12-year, as you can  
7 see, are almost indistinguishable besides the fact that the  
8 12-year lookback period still captures the 2008 stress and the  
9 10-year doesn't.

10 Another question is whether introducing a floor  
11 would make any significant difference. Well, let's see that.  
12 Next slide, please. Here we quantify the tradeoff between  
13 procyclicality and costs. We assume that we have a 10-year  
14 floor. That is the dotted line that we saw before.

15 We use it to measure how procyclicality is reduced  
16 in those circumstances. It turns out that we would need to  
17 increase the floor by a factor of around two before we see any  
18 significant reduction in procyclicality. So, clearly, there  
19 is a limit to what can be achieved by increasing the floor if  
20 we want to keep clearing economically efficient.

21 There are additional risks of the CCP that we have  
22 to take into account. Next slide, please. And that is  
23 what will happen in the event of default. So let's zoom

1       in to the worst days of the crisis and assess the effect  
2       of the standard anti-procyclicality tools. The 25  
3       percent, a margin buffer of 25 percent; stress VaR; and  
4       the floor, for which we use the 10-year historical VaR, the  
5       dotted flat line that we saw before.

6                  Next slide, please. So what we see when we  
7       assess the performance of these models with and without  
8       the existing measures is that, first, the stress VaR, which  
9       is the line that is at the beginning of the period above the  
10      rest, pushes margins up at the start, but then it ends  
11      dragging the margin down. This is an example of a  
12      prescription going wrong.

13                  The floor stops having an impact after the  
14      27th of February. And the buffer is consumed by the 6th  
15      of March.

16                  So, in summary, while we see that these tools  
17      mitigate margin changes at the start of the period, none  
18      of them will be able to prevent having a large margin  
19      increase later, a result which coincides to some  
20      observations that came out recently from the SEC.

21                  Next slide, please. So here is the same

1 situation but using the less sensitive model, the 10-  
2 year lookback period. The pattern is very similar.  
3 But, of course, we have less sensitivity and larger  
4 margin shortfalls.

5 Now the question is, well, how worse could  
6 this get if we are thinking of the worst-case scenario,  
7 where the member defaults on day T?

8 Next slide, please. So let's look at this  
9 worst-case scenario and measure the losses to the CCP due  
10 to margin shortfalls had the member defaulted on day T.

11 What we have here is on the left-hand side the one-year case  
12 and on the right-hand side the 10-year case. And, not  
13 surprisingly, a CCP using the less sensitive 10-  
14 year model, we face higher losses. But what is to note  
15 is that such losses are really high. They are something  
16 between 48 and 99 percent higher compared with 1-year; on  
17 average, 64. So I think a CCP using the less procyclical  
18 10-year filtered historical simulation model would effectively  
19 be subsidizing the risk of the portfolio, providing an  
20 incentive for the member to assume more risk.

1                   Next slide, please. So, in summary, we face a  
2                   three-way set of tradeoffs, which are here represented  
3                   graphically. You have to choose between procyclicality  
4                   and more risk to the CCP on the system or higher costs  
5                   of clearing.

6                   And we have a hard set of constraints. Models  
7                   have to provide adequate coverage. And clearing must  
8                   remain economically viable. We are trapped in some  
9                   ways. The limits that we can achieve either by  
10                  increasing the floor or by smoothing the risk model, we can  
11                  only move if you can see the little kind of solution set,  
12                  which is the green rectangle. That's where we can move  
13                  given the constraints and the conditions that we cover.

14                  In addition to that, the relations between  
15                  different factors are not linear. They are subject to  
16                  randomness, as we saw before. So differing sets of  
17                  events will produce different solution sets. The  
18                  extensions and tradeoffs will not go away. Therefore,  
19                  we argue, instead of insisting on local solutions, the  
20                  problems will be better addressed by acknowledging that  
21                  procyclicality is a systemic property and, as such,

1 require solutions that consider the system as a  
2 whole.

3 So next slide, please. So this is why we  
4 emphasize the importance of approaches which are more akin,  
5 for example, to those used in engineering or to  
6 assess the safety of complex systems; for example, nuclear  
7 And, of course, this is not new. We all know that the  
8 financial system is a complex system.

9 But it implies looking at interdependencies and to  
10 interactions across a system and to incentives and  
11 behaviors as well. In complex systems, safety  
12 requires several lines of defense. In our case,  
13 procyclicality mitigation has been a first line of  
14 defense, but other lines of defense are needed that  
15 consider how liquidity risk is managed and transmitted  
16 across the system.

17 Next slide, please. In conclusion, we all  
18 agree that initial margin models should be calibrated to  
19 address procyclicality to the extent that it is prudent  
20 and practical. But if at the end of the day fragilities  
21 in the system remain that contribute to adverse  
22 liquidity feedback loops, what else do we need to do?

1           Well, given the limitations that we have discussed, the  
2       answer cannot simply be to impose further constraints  
3       into initial margin models.

4           At least, these constrain or in general  
5       constrain the ability of the CCP to set prudent but  
6       adequate margins could have the double negative effect  
7       of incentivizing risk-taking on one side while curtailing the  
8       ability of the CCP to correctly collateralize its  
9       exposures.

10           So let me finish here. And thank you very  
11       much for your attention.

12           CHAIRPERSON KARNA: Thank you, Mr. Gurrola-  
13       Perez.

14           The second presentation will be from Nicholas  
15       Lincoln, Group Head of Market Risk and Liquidity Risk at  
16       LCH Group.

17           Please go ahead, Mr. Lincoln.

18           MR. LINCOLN: Thank you. I assume you can  
19       hear me.

20           CHAIRPERSON KARNA: Yes, we can.

21           MR. LINCOLN: Excellent. Well, good morning  
22       or good afternoon from London. Thank you for inviting

1 me here today and to the Committee and the  
2 Commissioners.

3 Now, I know there has been a lot of debate and  
4 chat about the initial margins increasing at the CCPs  
5 during the period of COVID. So I thought you might like  
6 to get a little bit of insight into why that happens.  
7 And I put together two examples where I have performed an  
8 attribution analysis, a very simple attribution, of the  
9 change, what's driving the change in initial margins in  
10 two of the markets that we clear. So the first market  
11 we are going to look at is the European cash equity  
12 market, and the second market we will look at is the  
13 global rates market, or interest rate swap market. I  
14 hope you will find it very interesting.

15 And I think we can probably move to the next  
16 slide. So, first of all, we will start with European  
17 equity clearing at LCH. This is actually provided in  
18 our service called EquityClear. And this provides  
19 clearing for cash equities and cash equity equivalents.  
20 The service clears on average of about 7 million trade  
21 sides per day across 18 different trading venues  
22 throughout western Europe. It is multi-currency, multi-

1 CSD type of business.

2 We are going to look at the critical two-month  
3 period from the 1st of March to the 30th of April, 2020  
4 because this was where most of the volatility was  
5 observed.

6 Over the period, we chart the initial margin  
7 requirements at the service level. And then we will  
8 chart the same initial margin requirements but keeping  
9 the positions constant from the start of March. Now,  
10 the purpose of this calculation is to attempt to isolate  
11 the effect of the LCH margin calculation on the  
12 participant portfolios. So hopefully you can see this  
13 chart in front of you now.

14 So this is EquityClear. So along the x-axis  
15 is the time, the two months, March and April. And then  
16 on the left-hand axis, the y-axis, that's the initial  
17 margin. So typically the service would be around three  
18 or four billion in margin. And if you follow the blue  
19 line, through early March, that increased right up to  
20 about 8.2 billion by the 20th of March. That, you know,  
21 almost doubled, doubled increase in margin.

22 When you strip out the volume impacts to all

1       of the increase in trading and positions through that  
2       period and then measure the increase in margin on  
3       that constant portfolio, around the same date, that  
4       would have risen to about 4.6 billion, on the 20th of  
5       March, which is about a 16 percent increase from the  
6       start of the month. So that when you read this  
7       analysis, you know, it's quite stunning, actually, how  
8       little the margin increased. And that, by far, the  
9       biggest driver of the headline margin was just the  
10      activity, which shouldn't really come as much of a  
11      surprise given what was going on at the time.

12           And then as you follow through to the end of  
13      March and into April, you can see the volume then return back  
14      to more normal levels. And so do the initial margin  
15      requirements, which sort of get back to about four  
16      billion. But, you know, we found this chart  
17      interesting.

18           And just on the volume side, as I said,  
19      typically we might clear around seven million a day.  
20      During that first 2 weeks of March, in that particular  
21      service, we were up to around 20 million trades a day,  
22      so a little over 3 times the normal volume.

1                   And to compare to prior crises because, you  
2                   know, we have been through a few, what was interesting,  
3                   it did persist. The volumes persisted, you know,  
4                   beyond one or two days. It really was almost every day  
5                   for about two weeks we were seeing persistently high  
6                   volumes compared to the average.

7                   So if we move on, the second market which we  
8                   looked at was the global interest rate swap market,  
9                   which is cleared in a service called SwapClear. So  
10                  SwapClear services, literally hundreds of interest rate  
11                  products in 27 currencies, encompassing tenors stretching  
12                  from 1 month to 51 years and referencing literally  
13                  dozens of different benchmark rates. Obviously, it is a  
14                  market that has very deep liquidity and serves, you  
15                  know, a broad range of participants who have access to  
16                  the vanilla IRS markets.

17                  So given the signs that go with that service,  
18                  it has been a good candidate to examine how the margins  
19                  evolved during the volatility of March and April 2020.  
20                  You should see a chart now that is the same calculations  
21                  that we ran on the equity business, but here we run it  
22                  on SwapClear. The first thing you will notice is that

1       on the y-axis, the left-hand side, the numbers are much  
2       bigger. So we are starting at around 149 billion in  
3       margins in the service. And then that grows to an  
4       initial peak of around 170 billion at about the 12th of  
5       March. It is about a 14 percent increase, close to 20  
6       billion increase in margin.

7           Again, however, if you struck out the volume  
8       impact and look at the margin increase on the constant  
9       portfolio, which is the orange line, you can see at  
10      around the same time, the 12th of March, it was about +4  
11      percent. Now, that continued to rise, peaking at about  
12      +14 percent towards the last week of March. And then  
13      you can see by the end of March and through April, it  
14      starts to settle down again. Volumes return to more  
15      normal levels. And the service sort of readjusts to  
16      around about 160 billion.

17           So, again, you see a striking impact of that  
18       volume, which is the dotted line, and the right-hand  
19       side scale, you know, contributing close to 10-20  
20       billion in additional margins just from amended  
21       activity.

22           So, you know, when you look at that, you think

1 to yourself, well, obviously, any margin call to a  
2 clearing member is a draw on the liquid resources of  
3 that clearing member. It is a liquidity drawdown. And  
4 clearing members, you know, they stress that the  
5 liquidity requirements, you know, on a daily basis, they  
6 try and estimate, you know, what is the worst margin  
7 call that could happen, you know, on the CCP that I'm a  
8 member of? And what this analysis shows is that during  
9 those stress test models, you just won't be looking at  
10 volume or position size as one of the risk factors. And if  
11 you are stressing the volumes, particularly in an equity  
12 market, you know, you want to be stressing that  
13 probably at least to double, maybe even triple the  
14 volumes because that will have a big bearing on the  
15 margin calls from the CCP.

16 So maybe to wrap up, the point today was really  
17 just to share with yourselves some analysis to provide a  
18 little bit more insight into two significant markets  
19 that a CCP serves, in this case LCH. Both cases show  
20 that the activity from market participants will have a  
21 considerable bearing on the margin requirements demanded  
22 from the CCP. As far as adding volume effects to  
23 participant liquidity stress-testing regimes, it may be

1           beneficial to better size the potential liquidity draws  
2           from CCP margin calls.

3           And, of course, the CCP risk models  
4           themselves, they will also have an influence, as Pedro  
5           has pointed out, on the required margins. But in these  
6           two cases, during March 2020, you can see that the  
7           impact has actually been unexceptional.

8           So I will pause now. And that is the end of  
9           my presentation. Thank you very much.

10           CHAIRPERSON KARNA: Thank you very much, Mr.  
11           Lincoln.

12           The third presentation will be from Ulrich  
13           Karl, head of clearing services at ISDA.

14           Please go ahead, Mr. Karl.

15           MR. KARL: Good morning, everybody. So I  
16           would like to start by thanking Commissioner Stump and  
17           the Global Markets Advisory Committee for the  
18           opportunity to present our paper.

19           And can I have the next slide, please, Andrée?  
20           So the ISDA Clearing Member Committee after the market events

1       in March was very interested in how CCP risk management  
2       frameworks performed during the crisis. And we talked to  
3       quite a lot of CCPs, most of the larger CCPs. We sent  
4       questionnaires to all of the other CCPs. So our  
5       analysis was pretty much based on 97 percent of CCPs by  
6       risk. So we essentially counted the default fund  
7       contributions as per public quantitative disclosures.

8                   So, as you might know, kind of we dealt with  
9       the crisis very well. So we had three member defaults  
10      globally. The one is one from Ronin Capital at CME and  
11      DTCC. There were two smaller defaults at small European  
12      energy CCPs. None of them threatening financial stability.  
13      And we also didn't get any issues reported in our calls  
14      with CCPs about key participants that maybe didn't meet  
15      their margin calls in time, other than a few isolated  
16      operational delays, which were apparently in one case not  
17      able to redeem team member sales but paying for it.

18                   So I think overall CCPs and their participants or  
19      team members and clients did very well with the record  
20      volume and volatility. And that is while pretty much

1 everybody was working from home.

2 I think one factor that came into that very  
3 much was that financial institutions are now much better  
4 capitalized and have higher liquidity reserves. And  
5 obviously the central bank intervention also had mitigated  
6 stress.

7 So, overall, we think the system held up very  
8 well. And, however, we would like to make recommendations  
9 in two areas. One is to introduce measures to mitigate  
10 procyclicality. And the other one is to enhance CCP public  
11 quantitative disclosures.

12 Before I get to them, next slide, please. I  
13 would like to sum up the findings from the CCP feedback  
14 we got in our calls or from questionnaires.

15 So, overall, most CCPs are actually very happy  
16 with the performance of their margin frameworks. So  
17 CCPs using frameworks, their model picked up on  
18 increased volatility automatically more or less. Other CCPs  
19 either used scheduled or unscheduled reviews for  
20 parameter update or in minor model changes. And one CCP  
21 reported that they applied an add-on to their margin  
22 while they were recalibrating their margin model.

1                   As to be expected, all CCPs observed increased  
2                   number of back-testing breaches, but, overall, CCPs told us  
3                   that their margin coverage was within their risk appetite, so  
4                   they had a kind of pre light or if they had issues, they applied  
5                   changes very quickly after, also confirmed later by public  
6                   quantitative disclosures.

7                   In terms of offsets between products, most  
8                   CCPs stated they didn't apply any, at least not outside  
9                   the regular reviews anyway. They said that these offsets are  
10                  very conservative anyway. And one CCP told us that they  
11                  classified a small list of products differently to remove  
12                  them from the portfolio margining. That's pretty much that.

13                  When we put our questionnaire together, that  
14                  was fairly soon after the WTI futures price trended  
15                  negative. So we also asked CCPs about impact of  
16                  negative prices. And most CCPs we talked to had already  
17                  reviewed their systems and processes. And, in  
18                  fact, they were all ready to deal with negative prices.

1       Others were in the process to do so; there were quite a few  
2       CCPs where negative prices wouldn't happen.

3               In terms of investment, that is not so much an  
4       issue for the U.S.; that is more a European topic. If CCPs  
5       use the repo market to invest cash, none of the CCPs actually  
6       told us that they did encounter problems doing so.

7               And talking about cash liquidity requirements,  
8       most CCPs told us that their liquidity requirements  
9       had not changed during the crisis, a recommended course  
10      based on strategy anyway, or if they had, had increased,  
11      they were covered by available resources.

12               Moving to default management, all CCPs said  
13      they would be able to manage default, either remotely or  
14      some of them had staff levels in the office if that was  
15      required. One CCP even told us that they had rented a  
16      hotel to make it easier for the staff in the office.

17               Quite a lot of CCPs told us--and I reckon it is by now even  
18      more--told us that they had already run trials under the  
19      working-home conditions and confirmed that they would be  
20      able to manage the default. And all CCPs said that they  
21      could continue with the working arrangements indefinitely.

22               We had these calls mostly in summer last year.  
23      So I think maybe, back then most people were maybe a little

1       bit more optimistic that staff could come back. I think  
2       maybe they are quite near to indefinitely already.

3                   So in terms of default management groups, if a  
4       CCP had one or required one, it usually had to be in-  
5       person in the office so the CCPs you talked to that used  
6       default management groups either had or were working on  
7       virtual ways to convene the default management group in  
8       a safe way.

9                   And, finally, there were some reports of  
10      defaults or closeout of clients, but there was hardly  
11      anything made public. So we can pretty much only know  
12      about the fact but not about the content or details.

13                  Next slide, please. So, going back to our  
14      proposals, procyclical margin first. And before I start,  
15      I really want to highlight that we don't blame CCPs or  
16      say that margin models were blindsided, as is sometimes  
17      reported in the press. Key participants knew how margin  
18      models would work and what would happen if volatility  
19      would spike up. I think in a real-life procyclicality,  
20      in a real-life crisis, maybe why a sense that the  
21      topic should be based on their experience.

22                  So we are not talking about variation margin  
23      because that reflects the profits and losses of members

1 and redistributes liquidity. And given the large market  
2 swings, that was pretty much unavoidable that we  
3 had large increases in variation margin. But you have to  
4 pay your profits and losses. You can't do anything  
5 about it.

6 And, as Nick already said, initial margin if  
7 it is procyclical can drain liquidity from the markets  
8 at greater levels during times of stress. And we saw  
9 for some products, margin rates increased by more than  
10 300 percent.

11 Something that surprised me when we had the  
12 discussions with CCPs is how many CCPs around the world  
13 actually aligned their anti-procyclicality tools with EMIR  
14 requirements. But, nevertheless, even doing so with these  
15 anti-procyclicality tools were insufficient to mitigate  
16 procyclicality.

17 As a side comment, giving it up for ISDA, in  
18 the uncleared margin markets, that margin is the ISDA SIMM  
19 model, which didn't really show that much procyclicality in  
20 tests performed very well last year. The estimate of the  
21 service in including a buffer on top of the margin that would  
22 have been required by the regulation. But, explicitly, I just  
23 mention that we do not propose CCP models to be calibrated in a

1 similar way.

2 So next slide, please. So Pedro has already  
3 shown some of the issues with anti-procyclicality tools. So  
4 the 10-year floor, while it is easy to calculate and to  
5 apply, given it was 10 years, that meant that the 2008  
6 stress period has already rolled off the lookback  
7 period. So that potentially should be extended or at  
8 least reviewed. And, once margin is above the floor, as Pedro  
9 showed, this tool has no impact whatsoever.

10 The 25 percent buffer, if you see that for  
11 certain products, margin rates increase by 300 percent.  
12 It was maybe not the right number. It seems pretty  
13 arbitrary anyway. So we think that this buffer needs to  
14 be calibrated dynamically and based on the underlying  
15 contracts.

16 And there is also some insufficient guidance  
17 when the buffer can be released or should be released.  
18 And we believe that some CCPs didn't release them at all.

19 And, finally, stressed scenarios in the  
20 lookback period. We believe that CCPs who used this  
21 tool seemed to have experienced lesser margin increases  
22 or not as significant ones as other CCPs. And I think  
23 that is pure math. It is if 25 percent of your scenarios are

1           stressed, then they will very likely try for 99  
2           percentile or whatever percentile you use. And if not,  
3           then you're in stress periods at the moment.

4                         So in terms of recommendations, the first  
5           recommendation is to review and recalibrate anti-  
6           procyclicality tools so that similar products exhibit  
7           comparable levels of procyclicality. That is not to say  
8           that they should necessarily require prescriptive regulation  
9           but potentially would be better if the market plus  
10          regulators agree on an outcome; for instance, maximum  
11          rates of increase over 1 day and 30-day, maybe like in a  
12          sense since we are moving portfolio changes into  
13          measures. If an outcome like that could be agreed, then  
14          CCPs could design their models accordingly as they see fit  
15          without prescriptive regulation.

16                         There should be also some additional guidance  
17          on governance and measurement of the effectiveness of  
18          anti-procyclicality tools and especially adding  
19          transparent standardized measurements of metrics of  
20          anti-procyclicality tools into the public quantitative  
21          disclosures and also into CCP disclosures to clearing  
22          participants.

23                         Next slide, please. And, then, finally, the

1 second set of recommendations is about the frequency of  
2 public quantitative disclosures. And you will know  
3 that the public quantitative disclosures, as prescribed  
4 by CPMI-IOSCO, they are quarterly. So they report always  
5 for a quarter. And there is a three-month time lag.

6 And given the March stress, quite a lot of key  
7 members were very keen to understand more about back-  
8 testing of breaches, how many, how big, but they had to  
9 wait until the end of June to get data on them. And for  
10 April back-testing breaches, we had to wait even longer,  
11 five months, until the end of September.

12 Also, there are some differences in how CCPs  
13 report or measure of back-testing breaches. So some  
14 include margin add-ons, others not. And accounts,  
15 the populations on which back-testing is aggregated,  
16 that seems to differ between CCPs as well.

17 So in terms of recommendations, so the first  
18 recommendation is that CCPs should report some data points  
19 from the public quantitative disclosures; for instance,  
20 initial margin, default fund, and especially back-testing  
21 breaches, monthly with a one-week time lag.

22 We think that should be part of CPMI-IOSCO  
23 guidance because otherwise if it is not regulatorily prescribed,

1           it will be a first mover disadvantage. And there might  
2        be also disadvantages or issues for CCPs in terms of  
3        their financial reporting. So if it is a regulatory requirement,  
4        it would be easier for the CCPs as well.

5           And the second one, as I just mentioned, to  
6        further standardize reporting of back-testing breaches  
7        or, actually, the calculation of them and focus a bit  
8        more on also more granularity.

9           Yes. That concludes my presentation. Thanks  
10      for listening.

11           CHAIRPERSON KARNA: Thank you very much, Mr.  
12        Karl.

13           The floor is now open for questions and  
14        comments on the presentation. And, again, as a  
15        reminder, if you have any questions or comments, please  
16        use the chat function on the WebEx to indicate that you  
17        would like to speak. Ms. Koh, do you have any comments  
18        to add?

19           MS. KOH: Yes, I do. I am Agnes from the  
20        Singapore Exchange. I would like to thank the  
21        Commissioner and Andrée for organizing and giving me the  
22        opportunity to speak tonight on a topic that is very  
23        close to my heart; that is, on CCP margining. I would like

1 to complement on what Pedro and Nick had mentioned and  
2 also to address some of the points that Ulrich has mentioned.

3 I think the issue around anti-procyclicality  
4 measures included in the margin are to enable  
5 predictability is really for participants, believing that  
6 doing so will lessen the liquidity risk and funding risk  
7 on themselves. But, really, for me, when I look at the  
8 further guidance that has come about in 2017 from CPMI,  
9 many of the CCPs have already instituted much of the  
10 guidance on margin models, be it APC cost and many,  
11 many other factors that have been dropped in.

12 As Pedro mentioned, having that procyclical  
13 margin and APC floor is really just one aspect of margin  
14 models. We do as a CCP really need to also be responsive  
15 to the current risk. And it is really a -- we could be  
16 assigned to an art of striking a healthy balance between  
17 having margin floors and the responsiveness of risk.

18 And, then, we mustn't forget that the floors  
19 as recommended or guided by the regulators, CPMI, was  
20 really to make sure that in periods of low volatility,

1       margins are not set too low and, hence, the various  
2       recommendations. And we know that in ISDA, they have  
3       prescribed certain models to abide by. But it was never  
4       intended to cover all periods of volatility. And there  
5       was no possibility perhaps of even setting floors at  
6       such a level that you could have covered the COVID risk  
7       that we saw in March. So I see it as, how do we strike  
8       a balance?

9                     The experience we had in Singapore Exchange  
10          with regards to March 2020 was very much the increase in  
11          margin calls. I would say about 85 percent of the calls  
12          during that period came from variation margin calls, rather  
13          than from an increase in initial margin. But,  
14          nonetheless, I would agree that tweaking the margin  
15          model has had a positive impact for us. Prior to 2018,  
16          our margin models were possibly extremely responsive to  
17          current events. And with a tweak where we have put in  
18          margin flows, that was not so much a direct usage of the  
19          25 percent 10-year --

20                     (Technical interruption.)

21                     CHAIRPERSON KARNA: Yes. Please go ahead, Ms.  
22                     Koh.

1 MS. KOH: Sorry. But we set a dynamic floor  
2 using both of these tools. At a minimum, it has to be  
3 25 percent. And then we look at where it is versus the  
4 10-year threshold, and then we will define the floor.  
5 And that changes as volatility increases and we were  
6 exhausted.

7 So these are tools that when we look at our  
8 margin models, we actually worked with our membership.  
9 So that creates that buy-in, that transparency, which  
10 helps in the discussion. So that's one area I think  
11 that could help bring the dialogue between CCPs and the  
12 participants.

13 The second area was when I look at the  
14 discussions that have been going on around the funding  
15 and liquidity because it all leads to that point, it  
16 perhaps in some of the discussions around liquidity,  
17 maybe some of the operational things that could be done  
18 -- at least if I could share what we do in Singapore  
19 Exchange. For one, we schedule all of our intraday  
20 calls. So participants are very aware that these are  
21 the scheduled calls and the timing by which the payments  
22 have to be made. There are no ad hoc calls per se. We

1 do it sufficiently frequently so that there are two  
2 calls in the day and another one in what we call the  
3 late cycle.

4 Then the other thing that was done in more  
5 recent years is because we operate in an offshore market  
6 where the underlying currencies by which we settle are not our  
7 domestic currency, we have always been conscious that it  
8 might be challenging sometimes for our participants. So  
9 over the years, we have let through collateralization of  
10 our intraday calls. Essentially, we require -- we do  
11 allow the gains to be credited against the margin  
12 requirements, but losses can be collateralized with the  
13 excess margins or even government securities that we  
14 have with us. So that lessens the liquidity impact.

15 So I am just looking at, how do we move  
16 forward on this because there is no possibility that we  
17 could actually set margin floors at such a level that it  
18 can be conducive to clearing. It will certainly  
19 increase the cost, but perhaps look for what ways that we  
20 can find a middle ground that really helps ensure that  
21 CCPs cover the risk because that is essential and still

1           for participants to be aware of what they need to do to  
2        manage that liquidity as well.

3           That is all my comments for the moment. Thank  
4        you.

5           CHAIRPERSON KARNA: Thank you very much, Ms.  
6        Koh.

7           Ms. VedBrat?

8           MS. VEDBRAT: Thank you, Angie.

9           This was a very informative session. I just  
10       wanted to make a few comments looking at the impact, you  
11       know, from the buy-side perspective.

12           I think it is important, you know, for us to  
13       be able to essentially look at the margin methodology  
14       models and see if there could be something, you know,  
15       done to those models in order to make the increase of,  
16       you know, IM on the clients a little bit, you know, more  
17       gradual than what might have been experienced in March.

18           So, you know, recognizing that there is a balance on  
19       risk management and cost and, you know, the fundamental  
20       reason why we have increased use of clearing is to help  
21       mitigate some of the bilateral risks that we have and it's a  
22       very important element of our overall market.

1                   So if we could, you know, potentially look at  
2                   our models to see if there was a way that we could give  
3                   more transparency to the end clients, you know, such as  
4                   ourselves because we have intermediaries through the FCM  
5                   as well as adjust the IM margin methodology so that, you  
6                   know, we can avoid a material spike in a matter of a  
7                   very short period because, you know, that can have an  
8                   unintended consequence, especially since the assets that  
9                   we are allowed to post, the list of assets, are very  
10                  limited. You know, another way would be if we can  
11                  increase, you know, the list of assets that we could use  
12                  to post collateral and, you know, adhere to the margin  
13                  calls, to include, like, some of the very liquid, more  
14                  acceptable, you know, products that have been introduced  
15                  and more mainstream over the last decade.

16                  Angie, back to you.

17                  CHAIRPERSON KARNA: Great. Thank you very  
18                  much, Ms. VedBrat.

19                  Does anyone else have any comments, either on  
20                  how derivatives clearing worked during the pandemic or  
21                  any other suggestions for regulators to consider with  
22                  respect to addressing any concerns relating to the

1 market volatility that we saw in the pandemic?

2 MS. KONG: Yes. If I may?

3 CHAIRPERSON KARNA: Yes, please, go ahead, Ms.

4 Koh.

5 MS. KONG: Sure. Yes. This is Janet from bp.

6 CHAIRPERSON KARNA: Oh, sorry. Go ahead.

7 MS. KONG: I would like to thank all of the

8 panelists for their excellent presentations. They have

9 basically brought to the front a tradeoff we might face

10 if we want to review the procyclicality in the margin

11 requirements versus providing the right safeguards for

12 the stress and safeguarding in central clearing.

13 From a market participant's perspective, our

14 participation in the futures market throughout March,

15 April, last year's volatile trading period, has been

16 that we are comfortable with the way the margin has been

17 set. And we were prepared for increased requirements

18 as volatility spiked during those volatile times.

19 What I find, the point made by Mr. Karl, was a

20 very relevant one as, going forward, key people won't

21 accept the tradeoff and tradeoff is in vain. If we

22 want to reduce the initial margin procyclicality, that

1       probably necessitates a relatively increased initial  
2       margin during the low-volatility period that increases  
3       the cost of all market participants. Is that efficient?  
4       Maybe, in other words, if we don't want to make the call  
5       prior for people to be essentially cleared participants  
6       in the futures market, can we give more transparency to  
7       the market participants in anticipating what kind of  
8       funding needs might arise during the volatility spike so  
9       they can prepare their funding, anticipating and  
10      watching the volatility spikes up, as what happened in  
11      last March.

12           So, in other words, the clearing member needs  
13      more information about the correlation between  
14      volatility spikes and a margin requirement changing  
15      based on the model used, adopted by CCP. So that  
16      transparency probably could go a long way in helping  
17      address some of the stress caused by the margin call and  
18      give participating members time to understand and  
19      prepare for that.

20           That is my comment.

21           CHAIRPERSON KARNA: Great. Thank you very  
22      much, Dr. Kong.

1                   Mr. Yamada?

2                   MR. YAMADA: Yes. Thank you, Angie.

3                   First off, we wanted to thank you and  
4                   Commissioner for, frankly, putting these important  
5                   topics back on the agenda. And I know we addressed them  
6                   a bit at the last meeting. But it definitely requires a  
7                   bit more granularity and a deeper understanding. So  
8                   thank you again for adding this to the agenda.

9                   The first thing I wanted to acknowledge was  
10                  that, on the whole, we very much agree with the ISDA  
11                  view that, overall, the global clearing infrastructure  
12                  remains generally very resilient. And from an  
13                  operational, technological, and business resilience  
14                  standpoint, during the dynamic stress, which in many ways is  
15                  greater than the financial crisis of '08, the system  
16                  held up relatively well.

17                  And now, that said, we also agree with ISDA's  
18                  assessment that, while not universal in certain  
19                  instances, certain CCPs, the initial margin increases  
20                  were clearly quite procyclical and did exacerbate some  
21                  of the stress we saw in the system and may have  
22                  increased market dislocations and funding stress for

1       some of our participants and, frankly, some of our  
2       clients. And as participants in multiple pieces of that  
3       and both in the listed space and the OTC space, we did  
4       see some discrepancies across those client sets.

5               Now, on the whole, we very much support ISDA's  
6       recommendations to enhance the anti-procyclicality  
7       measures and, frankly, the other recommendation for CCPs  
8       to provide more timely and transparent accountability on  
9       the effectiveness of some of these measures. We do think  
10      that will go a long way to at least allow more  
11      reactiveness to some of these stresses. But more  
12      broadly, the WFE correctly pointed out in its  
13      presentation, this isn't solely a procyclicality issue.  
14      It is one of the issues for sure, and it is worthy of  
15      addressing. But the overall interconnectiveness of the  
16      system and, you know, frankly, the ongoing efforts under  
17      Commissioner Behnam's leadership at the MRAC, they are  
18      addressing some of the enhancements to CCP risk  
19      management, transparency in government, as well as some  
20      of the capital requirements. Well, we believe that's  
21      part of this overall picture. And we are very  
22      supportive of a comprehensive view across this and the

1 procyclicality issue to make improvements to enhance the  
2 stability of the overall system.

3                   More specifically, if you will allow me, we  
4 did notice the WFE presentation did present a pretty  
5 clear tradeoff between commercial and, frankly,  
6 competitiveness and the robustness of this procyclicality or  
7 anti-procyclicality measurement. Well, we certainly agree  
8 that these tradeoffs exist. As a participant in both  
9 the OTC market and the futures market, we did notice a  
10 very broad and clear distinction. And some of that was  
11 highlighted in the LCH presentation, where they -- I  
12 think the measurement was like something on the order of  
13 adjustment for volume only a 14 percent general  
14 increase in the IA; whereas, in some of the WFE  
15 statistics, I think those numbers were between 150 and  
16 300. So that is a very significant divergence across the  
17 portfolios of WFE members.

18                   And, very frankly, our view is that in those  
19 -- not to call attention to one particular market, but  
20 the ETD market, in particular, did cause our clients and  
21 our system quite a bit more systemic stress and

1 disruption and a lot more follow-on effects and  
2 interconnectedness effects than the derivatives market.

3 So, to that end, I actually want to pose a  
4 question perhaps to our LCH colleagues. You know, it  
5 was very clear that, in our minds at least, the LCH  
6 framework definitely helped calm the OTC derivatives market  
7 a bit and lead to less disruption. So my question would  
8 be, you know, are there lessons to be gained and best  
9 practices to be shared? I know this is a significant  
10 divergence, maybe not significant but there is a notable  
11 divergence between the methodologies used and the  
12 procyclicality modeling across the LCH and some of the  
13 other members.

14 Perhaps if the LCH could help illuminate --  
15 what is it that they thought was the most impactful  
16 difference in their methodologies that helped reduce  
17 some of that and that stress and volatility? And if  
18 they could spend some time maybe illuminating for the  
19 committee, I think that would be very, very helpful.

20 CHAIRPERSON KARNA: Thank you, Mr. Yamada.

21 Mr. Lincoln, do you have some feedback?

22 MR. LINCOLN: Sure, sure. Excellent question,

1 by the way. I certainly don't want to create a divide  
2 between OTC and futures -- I mean, we clear both. Our  
3 clearinghouse in Paris cleared the Euronext markets.  
4 And there we have the CAC 40 futures contracts. And  
5 these are what I would call marquis contracts; right?  
6 Every CCP, every market has their - I would call marquis  
7 contracts.

8                   And you will find when you dig into it, you  
9 know, I'm generalizing here, that a large portion of  
10 the risk is probably tied to literally a handful of  
11 contracts. So if there's equity volatility, you know,  
12 futures on S&P or options on S&P, you know, that could  
13 be a big part of everyone's risk. So, therefore, you  
14 know, the behavior of those risk models or margin could  
15 actually have quite a big impact while the behavior of  
16 the other contracts, which I'm sure are in the hundreds,  
17 may have no impact. That is the first thing you need to  
18 look at, though. You know, it's looking at the market  
19 and the contracts in those markets where your exposures  
20 are and where you are most prone to a jump in margin  
21 and, therefore, a draw on your liquidity.

22                   Now, in LCH's case, yeah. We looked at this

1 back as early as 2015 and put together a risk policy.

2 Now, I won't bore you on the details, but essentially we  
3 do apply the long-term floor. In Pedro's paper, we are  
4 probably closer to that 10- and 12-year floor. In some  
5 markets, it is actually the 12-year and the 2-year, the  
6 fixed period in our case, the GFC.

7 So that means, you know, for swap clearing,  
8 that rates business, before we entered COVID, a lot of  
9 the margins were already on that floor. Again, I'm  
10 speaking broadly. We have many risk factors. But for  
11 the most part, the major risk factors were already on  
12 the floor. So, therefore, when the volatility began, it  
13 actually had no impact on our margins at all. And it  
14 took quite some time for the volatility to sort of  
15 pierce, pierce that floor and for our margins to start  
16 to rise.

17 Obviously, as a few people today have pointed out,  
18 there is a tradeoff to that. If you don't react fast enough,  
19 you might actually be putting yourself at some sort of  
20 prudential risk, right? So that is the balance. And  
21 that balance is -- yeah, it's not easy to find; it

1        requires testing, lots of testing, refinement, testing  
2        under different conditions. And when you do find a good  
3        balance, which is what we have at LCH, that may not hold  
4        across every market. So that is really important  
5        because there is no one size fits all here. You can't  
6        prescribe standards and expect them all to work on every  
7        product and every contract around the world. You really need  
8        to look at the individual behaviors and the characteristics  
9        and the features of those contracts and markets that you  
10      operate in.

11           I think today someone had a very nice chart on  
12      the WTI. That is a deliverable contract, which brings  
13      delivery risk. You know, that's quite a unique risk. You  
14      know, the CCP or the risk manager or the model developer  
15      has to cope with in their model, which might not  
16      necessarily fit some sort of prescribed APC, you know,  
17      regulation. So I think you need to look at each market,  
18      each contract, and how it behaves under different  
19      conditions and design your models to cope with that as  
20      best they can.

21           And that is sort of what we managed to achieve

1           in LCH and including the futures market in Paris, which  
2        did move but certainly not more than we would expect in  
3        our case.

4           That was a longwinded answer, but I hope that  
5        answered your question.

6           CHAIRPERSON KARNA: Thank you very much, Mr.  
7        Lincoln.

8           Mr. Cutinho? Mr. Cutinho, do you have a  
9        comment? If so, you may be on mute.

10          SPEAKER: Hello?

11          CHAIRPERSON KARNA: Yes. We can hear you now.

12          SPEAKER: Yes? Hello?

13          CHAIRPERSON KARNA: Mr. Cutinho?

14          SPEAKER: Who?

15          MR. CUTINHO: Can you hear me?

16          CHAIRPERSON KARNA: Yes, Mr. Cutinho, we can  
17        hear you.

18          MR. CUTINHO: Okay. So I would like to  
19        respond to the comments that were just made. I know  
20        that, you know, we all take our most convenient  
21        viewpoints from every study. So this is true with the  
22        WFE study as well. So let's put a few things in

1 perspective.

2 So I know some of us have anchored in our  
3 comments to a 10-year floor or a 12-year floor or  
4 periods of stress. Just to establish some facts, for  
5 our contracts, we do have those floors. In fact, going  
6 into the pandemic in the February-March timeframe, we  
7 were -- our margins were in excess of those floors. So  
8 the floors themselves are not a panacea.

9 The second thing to point out is I think what  
10 is interesting in the WFE analysis is a difference  
11 between conditional variants and long-term variants,  
12 unconditional variants. So from a risk manager's  
13 perspective, it is important to make sure your margins  
14 have risk sensitivity. We need to cover our exposures.

15 A very narrow focus -- okay -- on anti-  
16 procyclicality is systemically risky. And that is an  
17 important takeaway from the WFE study. And that was  
18 true during the global financial crisis as well. You  
19 know, conditional variance is what affected the co-  
20 relations between the different underlying assets in a  
21 collateralized, you know, security. And that was  
22 mispriced. The correlations were mispriced.

1       Conditional correlations and conditional variance is an  
2       important factor and must be taken into account for  
3       margin.

4               Finally, I think one of the most important  
5       things, facts that was presented was around speed with  
6       which margins react. And here -I'll add to  
7       Janet's, you know, comments. As far as our futures  
8       markets are concerned, ETD markets are concerned, I know  
9       it is convenient to blame them for all problems. Most  
10      of the changes or increases in margin were variation  
11      margin, not initial margin. The ways with which margins  
12      increased were moderated. There were no ad hoc calls.  
13      There were no ad hoc intraday calls. There were no  
14      dramatic increases in margin rates day over day. In  
15      fact, the margins were changed. The entire market was  
16      given at least one day's, 24 hours', notice and complete  
17      transparency with margin rates on our website. Okay.  
18      So market participants could actually react to it.

19               So in many ways, I think let's put some  
20      numbers to some of these changes. If you look at S&P  
21      markets or even ETD in general, our open interest  
22      increased dramatically. Our open interest in S&P

1 contracts alone increased by about 23 percent. In spite  
2 of that increase in open interest, in spite of the  
3 volatility, in spite of our actions, the portfolio-level  
4 margin increases were muted -- okay? -- at most about 6  
5 percent.

6 If clients were expecting or experiencing  
7 increased margins, one of the areas that we cannot speak  
8 to is what some members do with their own clients. They  
9 can charge more margin than what an exchange charges.  
10 So we have less transparency into them.

11 What would be interesting to know is, are  
12 there institutions that are financing exchange margins?  
13 And did they experience stresses during this period? So  
14 those are the questions that are interesting, but very  
15 little data is presented here.

16 So when it comes to exchanges, you know, I  
17 think that -- and how majority of the CCPs behaved, the  
18 WFE paper is spot on. And those are the tradeoffs that  
19 are important to take into account. And I think most  
20 people think of costs. I don't think cost is an  
21 equation that enters into our mind. Our issue generally  
22 is, you know, the impact of a CCP's actions on our

1       members. And this is what drove our actions during the  
2       period of March and April.

3                     CHAIRPERSON KARNA: Thank you very much, Mr.  
4                     Cutinho.

5                     Mr. Yamada?

6                     MR. YAMADA: Yes. If I could address that,  
7       actually? I don't have any disagreement with anything  
8       you said. The one thing that I would ask for

9       potentially, which would help me personally understand  
10      it, is the WFE qualifiers are -- the members and the  
11      level of activity and cost in front of the dispersion of  
12      different product sets is pretty significant. And I  
13      think -- and, frankly, forgive me because I have much  
14      more of a rates background. But when I look at things

15      like "rates treasury futures" and "rates swaps markets"  
16      and I look at the kind of very different IM -- and VM  
17      obviously very similar, but the IM regimes were the things  
18      that were quite different. And the relative speed and scale  
19      of the increase in IM in the treasury market versus in  
20      the rates derivatives market was pretty starkly  
21      different. So perhaps it is not an overall WFE problem

1 or concern.

2 And I think, on the whole, you may be correct,  
3 but I think there is a subset of products, which,  
4 frankly, if you ask a rates market participant, many of  
5 them will be a futures as a -- and maybe depending on  
6 the types of risks they manage, but at least a substitute for  
7 using interest rate swaps. But they are under very different  
8 regimes and have different capital, different, you know,  
9 IM and capital requirements during times of stress.

10 And I don't think necessarily that -- and this  
11 may again not be the exchange problem. This may be a  
12 client education problem, your earlier point. But some  
13 harmonization of that and, frankly, education around  
14 that may be required here. And, frankly, and again  
15 to go back to the point of maybe best practices. Some  
16 of the lessons learned from the LCH, which clearly had a  
17 slightly smoother experience versus the rates treasury  
18 market we heard from our participants here.

19 There might be pockets where perhaps we can  
20 take a different approach while the overall approach, to  
21 your point, does seem relatively robust. The overall

1 system did help on the whole, but some almost product-  
2 specific alignment and consistency might be required.

3 So there could be an additional focus area going  
4 forward.

5 MR. CUTINHO: The rates market and the rates  
6 treasury market and the rates swap market are not the  
7 same. They are two different markets. Treasury market  
8 and -- no. It's too general a comparison that you draw.  
9 They are not the same market. They don't mean behave the  
10 same way.

11 MR. YAMADA: Well, I would say they are much  
12 more the same market than the S&P and VIX market, the  
13 rates market.

14 MR. CUTINHO: They have just about the  
15 same similarity as the word "rates." They are two  
16 different markets. One is LIBOR-based, and the other is  
17 treasury futures market, that the underlyings are  
18 treasuries. So the activity profile of the market  
19 participants, the market themselves are very different  
20 . The markets didn't move in a similar way. So to  
draw that comparison is to ignore the differences

1           between the markets.

2           MR. YAMADA: Part of the reason why  
3         traditionally markets that did move much more in a  
4         similar way might be because of the increased stress  
5         caused in the futures market.

6           So, again, it's not something that -- I mean,  
7         it's just something worthy of further analysis in my  
8         mind. And I'm not saying that that is a conclusion to  
9         be drawn.

10           CHAIRPERSON KARNA: Thank you, Mr. Yamada.

11           Thank you, Mr. Cutinho.

12           Does anyone else have any questions or  
13         comments for our panelists?

14           (No response.)

15           CHAIRPERSON KARNA: Great. I will now turn it  
16         over to Andrée to finish out the day's agenda.

17           MS. GOLDSMITH: Thank you so much, Angie, for  
18         moderating today's discussion. As always, we are  
19         so grateful for your chairmanship of this committee and  
20         your expertise in moderating these discussions.

21           I am now going to turn it over to the  
22         Commissioners for any closing remarks they may have. So

1 I will start with Chairman Behnam.

2 CFTC ACTING CHAIRMAN BEHNAM: Hi, Andrée.

3 Thanks for the conclusion. And thanks to Angie for  
4 chairing. And thanks to Commissioner Stump for her  
5 leadership.

6 This is a tremendous conversation, a lot of  
7 issues that are obviously, like I said in the morning,  
8 very ripe for discussion and different points of view  
9 but things that we need to analyze. And I can say for  
10 certain a lot of these issues are being discussed on  
11 a global scale and a global level among certainly different  
12 regulators but also multilateral organizations,  
13 specifically with CCP risk and margin. But certainly  
14 this morning's discussion on retail trading was  
15 excellent as well. A lot more work to be done for sure.

16 But I just want to thank Commissioner Stump  
17 again for her leadership and looking forward to more  
18 work from the GMAC. Thanks to the participants, the  
19 guests, and all of the staff from the CFTC, who put  
20 together excellent presentations. Thank you.

21 MS. GOLDSMITH: Thank you, Chairman.

22 Commissioner Quintenz? Commissioner Quintenz,

1           are you on the line?

2                         (No response.)

3                         MS. GOLDSMITH: Okay. I will move forward,

4                         then, with Commissioner Berkovitz.

5                         COMMISSIONER BERKOVITZ: Thank you, Andrée.

6                         And I would really like to thank all of the panelists

7                         and all of the participants in today's discussion,

8                         extremely informative, really provided a lot of

9                         information about the contribution in our markets,

10                         really insightful about retail participation, potential

11                         impacts, things to watch for, and really excellent

12                         discussion on margin and 2020 and the performance of

13                         clearing during the period of stress. So I really want

14                         to express my appreciation for everybody who

15                         participated truly across the globe on this. I'm very

16                         thankful to a lot of our technology staff who made this

17                         possible and thank everybody in the various time zones

18                         around the world. I am sure it is evening and early

19                         morning where some folks are.

20                         So, again, thank you, everybody. And thank

21                         you, Commissioner Stump, for putting together this

22                         excellent agenda.

1 MS. GOLDSMITH: Thanks, Commissioner

2 Berkovitz.

3 Commissioner Stump?

4 COMMISSIONER STUMP: Thanks, Andrée.

5 As all of the other Commissioners have said,

6 what a great benefit it is for us to have these timely

7 conversations. And I completely agree. I just wanted

8 to point out that I think we are particularly well-

9 served by the diverse viewpoints that are represented by

10 this particular committee, not only diverse in market

11 representation but also in the global representation.

12 And I think it is a tremendous benefit for us to hear

13 from the clearing members and the clearing

14 infrastructure and the market participants, whether

15 located in Asia, London, Europe, United States. And

16 today we had the pleasure of having a presentation from

17 a fellow regulator in Canada. So I am so thankful that

18 you all are willing to take time from your busy

19 schedules to work with us and work within this

20 committee.

21 And so I also want to recognize the tremendous

22 amount of work that goes into those who present for

1       these types of meetings, some today from our own  
2       CFTC. I am very grateful for the time and energy that  
3       you all devoted to preparing presentations and also to  
4       answering and fielding questions as well as those who  
5       represent various industry viewpoints. Thank you all  
6       for the time you put into the discussion and the prep.

7                   And with regard to prep, I also want to thank  
8       those who don't always get recognition at the CFTC. We  
9       have been doing this for a year. And it is never  
10      without some challenges when we have these types of  
11      virtual meetings, but I really am grateful for the folks  
12      at the CFTC who work behind the scenes to make these  
13      meetings happen. I feel as though we are able to do  
14      them on a more regular basis. And I think that serves  
15      the public quite well.

16                  And, lastly, I am so grateful, as always, to  
17      Chair Angie Karna for her remarkable ability to  
18      facilitate a meeting, and we always tend to end on time,  
19      which is quite remarkable; and Andrée Goldsmith for her  
20      tremendous organizational skills. So I hope, with that,  
21      everyone has a great weekend. And we look forward to  
22      continuing this discussion and drilling down further on

1 potential areas in which the CFTC can focus and adapt.

2 Thank you.

3 MS. GOLDSMITH: Thank you, Commissioner Stump.

4 And thank you, everyone, for attending today's GMAC  
5 meeting and to all of our presenters. This meeting is  
6 now adjourned. Thank you.

7 (Whereupon, at 11:49 a.m., the meeting was  
8 adjourned.)
