1 P R O C E E D I N G S

2 CO-CHAIR SCHAPIRO: Good morning. Chairman Gensler  
3 and I are pleased to welcome you and to call to order this  
4 first meeting of the Joint CFTC-SEC Advisory Committee on  
5 Emerging Regulatory Issues.

6 Today is May 24, 2010, and this meeting is being  
7 held in accordance with the Government in the Sunshine Act.

8 All members of the Committee except one are present  
9 either in person or telephonically. I believe Drs. Engle,  
10 O'Hara, and Stiglitz are on the telephone, and Dr. Ruder has  
11 an unavoidable conflict, although he may be able to join us  
12 later.

13 Before we begin, let me make a few logistical  
14 points. First, Gary and I are co-chairing the Joint  
15 Committee meeting and as co-chairs we'll share responsibility  
16 for leading our discussions today. So if you'd like to be  
17 recognized, please just turn your tent card on end, and we'll  
18 try to recognize you as soon as possible.

19 Also, for those of you who are joining us by phone,  
20 if you could please make sure you have your phone on mute  
21 when you're not speaking, that would be enormously helpful,  
22 as we are being Webcast and interference, I think, will make  
23 it difficult for many listeners and watchers.

24 And now, I want to turn it over to Chairman

1 CO-CHAIR GENSLER: Good morning. I would like to  
2 start by thanking Chairman Schapiro for all of her efforts on  
3 behalf of the investing public, as well as the staff of the  
4 SEC for hosting this first meeting of our Joint Advisory  
5 Committee on Emerging Regulatory Issues.

6 I also want to thank my fellow CFTC Commissioners,  
7 Mike Dunn, Jill Sommers, Bart Chilton, and Scott O'Malia, for  
8 all of their support in establishing this Joint Committee and  
9 for all of their work on behalf of the American public. I  
10 know that each of us look forward to receiving the advice of  
11 this expert panel.

12 It was during the presidential transition actually  
13 that Chair Schapiro and I first discussed possibly setting up  
14 a Joint Advisory Committee. Little did we think it would  
15 take a year and a half, a joint harmonization report, an act  
16 of Congress and, yes, a 1,000 point drop in the Dow before  
17 getting it done, but I'm pleased that we're here finally for  
18 our first meeting of the Committee.

19 And an Advisory Committee designed to view emerging  
20 risk in our financial markets is long overdue. While I am  
21 not suggesting if we had had this Committee up five or ten  
22 years ago we wouldn't have had the financial crisis, I do  
23 believe that there were emerging risks that demanded  
24 thoughtful analysis, whether they were the use of new

25 products like credit default swaps or developments in the

1 securitization markets or, more recently, rapid  
2 advancements in technology and significant changes in market  
3 structure. We can be certain that we will continue to see  
4 innovations in the markets that will require thorough review.

5 I think also that the CFTC and SEC will benefit  
6 greatly from hearing from an Advisory Committee together. In  
7 fact, this is the first time our two agencies have ever  
8 shared an advisory committee and that we have been two  
9 separate agencies since the 1930s. We both exist to protect  
10 the investing public and promote transparent, fair, and  
11 orderly markets.

12 Our two agencies' oversight spans across future  
13 securities and, hopefully shortly, the over-the-counter  
14 derivatives market places. It's essential that we work  
15 cooperatively to regulate these markets, and this Committee  
16 can assist us in achieving that goal.

17 The CFTC and SEC will benefit from having outside  
18 experts thinking about emerging risk to markets, advising us  
19 on them. This morning's meeting and more generally the Joint  
20 Committee is about looking around corners, looking into the  
21 future about where we need to take regulation.

22 And markets do change. Market structures,  
23 practices, technology, all change, and they change rapidly.  
24 There's constant innovation. I hope the Committee of outside

25 investors can help us insure that regulation stays abreast of

1 these changes.

2 Our panel is comprised of a diverse and  
3 accomplished group. I'm pleased that we have three former  
4 Commission Chairmen. We also have three distinguished and  
5 award winning professors of economics and finance, and a  
6 former director of one of the largest asset management firms  
7 in the world and head of an independent regulator.

8 The first task, of course, is we are looking at May  
9 6th. Those events have significant implications for  
10 investing public and the American businesses. It's essential  
11 we continue our review and with the contributing  
12 circumstances of price volatility, more work must be done to  
13 accomplish this goal.

14 The Committee has had an opportunity to examine the  
15 staff findings released. I wish to thank the staffs of both  
16 the SEC and CFTC, an enormous amount of work around the May  
17 6th report, and though there's much to do, the staff has  
18 examined liquidity dislocations, linkages between markets and  
19 the role of electronic and algorithmic trading, and today we  
20 look forward to hearing from the staffs and having the  
21 panelists ask questions.

22 With that, I thank you, and I turn it back to Mary.

23 CO-CHAIR SCHAPIRO: Thanks, Gary.

24 We're going to tag-team on the introduction of the

25 Committee members, but let me also acknowledge the presence

1 of my fellow Commissioners and thank them for their support  
2 really during the last year and almost a half that I've been  
3 here, but most particularly since the events of May 6th that  
4 have required us to move very quickly on a number of fronts:

5 Commissioner Kathleen Casey, Elisse Walter, and  
6 Troy Paredes, and I assume that Commissioner Aguilar will be  
7 joining us at some point.

8 Gary, do you want to start the introductions?

9 CO-CHAIR GENSLER: If I can just find where I'm  
10 supposed to turn to to do that. Ah, here we go.

11 We're pleased to have eight distinguished members  
12 of the Committee, and the Chair and I extend our appreciation  
13 for them taking the time. Now, if I may introduce, Chairman  
14 Born, if I may call her that, is a retired partner of Arnold  
15 & Porter, where she was the head of the firm's derivatives  
16 practice representing domestic and international clients and  
17 legislative, litigation, regulatory, and transactional  
18 matters involving derivatives transactions in financial  
19 markets from '96 until 1999. When we first met actually,  
20 Brooksley held the position that I am now honored to hold,  
21 the Chair of the CFTC. While at the CFTC, Ms. Born served as  
22 a member of the President's Working Group on Financial  
23 Markets and Technical Committee of IOSCO, and I believe  
24 currently is also on the Financial Crisis Inquiry Committee.

Do we tag-team or do I keep going?

1 CO-CHAIR SCHAPIRO: You keep going.

2 CO-CHAIR GENSLER: I keep going. There, I learned.

3 Rick Ketchum to my left is Chairman and Chief  
4 Executive Officer of FINRA. Before assuming his current  
5 responsibilities, he was CEO of NYSE Regulation from 2006 to  
6 2009. He served as the first chief regulatory officer of the  
7 New York Stock Exchange. Mr. Ketchum was previously General  
8 Counsel of the Corporate and Investment Bank at Citi Group.  
9 He also spent 12 years in NASD and the NASDAQ Stock Market,  
10 where he served as President of both organizations, and prior  
11 to that he spent 14 years at the SEC, has a wealth of  
12 regulatory and market knowledge. So we thank him for joining  
13 us.

14 CO-CHAIR SCHAPIRO: To my right is Jack Brennan,  
15 the Chairman of the Financial Accounting Foundation, Board of  
16 Trustees, which is the independent private sector  
17 organization responsible for oversight of the FASB and GASB.  
18 He also is the Chairman Emeritus and senior advisor of the  
19 Vanguard Group, which I believe is now the largest asset  
20 manager -- mutual fund company. Sorry.

21 Mr. Brennan previously served as Vanguard's  
22 Chairman and CEO and, among many other industry activities,  
23 was past Chairman of the Investment Company Institute and is  
24 a Governor of FINRA.

Professor Robert Engle, who is joining us by phone,

1 is the Michael Armellino Professor of Finance at New York  
2 University's Leonard N. Stern School of Business. In 2003,  
3 Professor Engle was honored with the Nobel Prize in economic  
4 sciences for his work in methods of analyzing economic time  
5 series with time varying volatility.

6 To Jack's right is Dean Susan Phillips. Susan has  
7 just retired as a Dean of the George Washington University  
8 School of Business. Her areas of specialization include  
9 monetary policy, regulation and supervision of financial  
10 institutions, derivatives, financial management, and the  
11 economic theories of regulation.

12 In 1981, Dean Phillips was appointed to membership  
13 on the CFTC, where I had the distinct honor and pleasure of  
14 working for her, and she became its Chairman in 1983.

15 Upon leaving the CFTC in 1987, she returned to  
16 academia at the University of Iowa, but then was called back  
17 to Washington to serve on the Board of Governors of the  
18 Federal Reserve System, and she has authored dozens of  
19 scholarly publications.

20 CO-CHAIR GENSLER: The next member of the Joint  
21 Committee joining us by phone is Professor Maureen O'Hara.  
22 Professor O'Hara is the Robert Purcell Professor of Finance  
23 at Cornell University's Johnson Graduate School of  
24 Management. Professor O'Hara's research focuses on issues of

25 market micro structure, and she is the author of numerous

1 journal articles, as well as the book Market Micro Structure  
2 Theory, which is going to be very helpful in what we're  
3 looking at here.

4 Her most recent research looks at the role of  
5 uncertainty in affecting the liquidity and valuation of  
6 securities.

7 Next, also joining us by phone is Professor Joseph  
8 Stiglitz. Professor Stiglitz is a Professor of Finance and  
9 Business at Columbia University and chair of the University's  
10 Committee on Global Thought. He is also the co-founder and  
11 Executive Director of the Initiative for Policy Dialogue at  
12 Columbia.

13 In 2001, he was awarded the Nobel Prize in  
14 Economics for his analysis of markets with asymmetric  
15 information. He was a lead author of a 1995 report of the  
16 Intergovernmental Panel on Climate Change, which shared the  
17 2007 Nobel Peace Prize, quite an accomplishment.

18 Professor Stiglitz was a member of the Council of  
19 Economic Advisors from 1993 to '95, and served as its chair  
20 from 1995 to '97. He has also served as Chief Economist,  
21 Senior Vice President in the World Bank; has chaired both the  
22 Commission of Measurement of Economic Performance and Social  
23 Progress and the Commission of Experts on Reform of the  
24 International Financial and Monetary System.

CO-CHAIR SCHAPIRO: And finally, last but certainly

1 not least is David Ruder, who has an unavoidable conflict,  
2 out of the country today and is unable to be with us, but  
3 David is the William W. Gurley Memorial Professor of Law  
4 Emeritus at Northwestern University School of Law, where he  
5 previously served as Dean.

6 From 1987 to 1989, Dr. Ruder served as Chairman of  
7 the Securities and Exchange Commission, and he is currently  
8 Chairman of the Mutual Fund Directors Forum.

9 We are, indeed, fortunate that this Committee is  
10 made up of some of the brightest minds in the country, and we  
11 are deeply in their debt that they have agreed to help  
12 provide the SEC and the CFTC with their views and  
13 perspectives on the emerging regulatory issues that affect  
14 both agencies. Chairman Gensler and I both look forward to  
15 benefitting from your insights and wisdom.

16 The establishment of this Joint Committee was one  
17 of the 20 recommendations included in the agencies'  
18 harmonization report issued last year. The mandate of this  
19 Committee is broad. It's charged with identifying emerging  
20 regulatory risks relating to both the SEC and the CFTC;  
21 assessing and quantifying the impacts of such risks,  
22 including their implications for investors and market  
23 participants; and furthering the agencies' efforts on  
24 regulatory harmonization.

The events of May 6th certainly highlight the need

1 to identify risks and engage in meaningful regulatory  
2 cooperation. As you well know, during a 20-minute period on  
3 that afternoon, the U.S. financial markets failed to execute  
4 their essential price discovery function, experiencing the  
5 decline and recovery that was unprecedented in its speed and  
6 scope. That period of gyrating prices both directly harmed  
7 investors, who traded based on flawed price discovery signals,  
8 and undermined investors' faith in the integrity and the  
9 fairness of our markets.

10 The events of May 6th serve to remind us once again  
11 that our financial markets are inexorably linked. Events  
12 that occur on markets regulated by one agency inevitably  
13 affect the markets regulated by the other. Given this,  
14 Chairman Gensler and I agreed that the first item on this  
15 Joint Committee's agenda should be to conduct a review of  
16 the market events of May 6th so that we can be sure we fully  
17 understand how market structures, disparate trading  
18 conventions, different rules across markets and other factors  
19 contributed to the events of that day, and so that we can  
20 begin to craft appropriate regulatory responses.

21 Over the last 18 days, the staffs of both agencies  
22 have been hard at work conducting a comprehensive  
23 investigation. Last Tuesday, CFTC and SEC staff released a  
24 joint report detailing the preliminary findings of our

25 investigation.

1           In addition to working with the CFTC on the joint  
2 report, at the SEC we have worked with the securities  
3 exchanges to fashion measures to help protect against a May  
4 6th recurrence by imposing a limit on the extent to which  
5 certain individual stock prices can move before trading in  
6 that stock is paused. These proposed circuit breakers have  
7 been published for comment for ten days.

8           At this stage we continue to focus on the events  
9 that may have triggered the unusual volatility, but  
10 regardless of the triggering cause, we believe that the  
11 initial volatility was magnified by a variety of factors.  
12 Areas I expect we will probe further with the Committee's  
13 input include the possible linkages between the steep decline  
14 in the prices of stock index products and simultaneous and  
15 subsequent waves of selling in individual securities; a  
16 generalized severe mismatch in liquidity possibly exacerbated  
17 by the withdrawal of liquidity by electronic market makers;  
18 the possibility that this liquidity mismatch may have been  
19 aggravated by disparate trading conventions among various  
20 exchanges; the possible involvement of stub quotes; the use  
21 of market orders and stop loss orders that might have  
22 contributed to market instability; and the impact on exchange  
23 traded funds which suffered a disproportionate number of  
24 broken trades.

Even before May 6th, the Commission had launched

1 initiatives to strengthen the U.S. securities markets and to  
2 protect investors. We had proposed rules that would prohibit  
3 flash orders, increase the transparency of dark pools of  
4 liquidity, prohibit broker-dealers from providing unfiltered  
5 access to exchanges, and proposals to create a large trader  
6 reporting system.

7 Earlier this year we also issued a concept release  
8 on market structure that solicited public comments on the  
9 impact of different trading strategies, including high  
10 frequency trading on our markets and investors. These issues  
11 will also be at the center of a market structure roundtable  
12 which we're holding in a couple of weeks.

13 And on Wednesday of this week, the Commission will  
14 consider a proposal to create a consolidated order tracking  
15 system to allow effective cross-market surveillance.

16 Let me thank the Committee again for joining us  
17 today, and I look forward along with you to the staff's  
18 presentation and ensuing discussions. So now I'll turn the  
19 meeting over to the staff so that the CFTC and the SEC, who I  
20 just have to say have been working tirelessly over the last  
21 18 days to present their preliminary findings to the Joint  
22 Committee.

23 Let me introduce Robert Cook, the Director of the  
24 SEC's Division of Trading and Markets, to introduce the

25 presenters.

1 Robert.

2 MR. COOK: Thank you, Chairman Schapiro.

3 Good morning. Before we begin our presentation, on  
4 behalf of all the staff, I'd like to welcome the members of  
5 the Joint Advisory Committee and to express our deep  
6 appreciation to you for agreeing to offer your time, your  
7 insights, your expertise to the Commission staff as we work  
8 to address the issues associated with the market events of  
9 May 6th and, beyond that, to further strengthen and harmonize  
10 the work of our two agencies. We look forward to working  
11 with you.

12 I'd also like to express our appreciation to our  
13 Chairmen and to the Commissioners from both agencies and to  
14 thank them for the invaluable leadership and support they  
15 provided us over the last few weeks. We look forward to  
16 continuing to work to strengthen our markets under your  
17 steady guidance.

18 I'm joined today by some colleagues from the SEC  
19 staff: David Shillman, Associate Director for the Office of  
20 Market Supervision in the Division of Trading Markets; and  
21 from our Division of Risk Strategy and Financial Innovation,  
22 Co-Deputy Directors Jonathan Sokobin and Gregg Berman.

23 I'd like to take this opportunity to thank the many  
24 staff at the SEC both here in Washington and the many

25 regional offices who have been working very hard over the

1 last few weeks and who will be working very hard over the  
2 coming weeks on this project. There are far too many names  
3 to mention, but their contributions deserve our collective  
4 appreciation and acknowledgement.

5 Let me turn it over to my colleague, Steve Sherrod,  
6 to introduce his staff.

7 MR. SHERROD: Thanks, Robert.

8 I want to join Robert in thanking the Advisory  
9 Committee and my Commissioners and Chairman Gensler --  
10 particularly at last Friday's surveillance briefing where  
11 they asked many probing questions that we continue to  
12 investigate.

13 Joining me today are Andre Kirilenko from our  
14 Office of Chief Economist, on my left, and Richard Shilts,  
15 the Director of our Division of Market Oversight.

16 As Robert mentioned, we have had a tremendous staff  
17 effort to bring all hands on deck to work on this issue over  
18 the last two weeks.

19 Robert.

20 MR. COOK: So just to briefly review the agenda for  
21 this morning, first Steve is going to provide an overview of  
22 the general market conditions on May 6th to set the stage and  
23 the context for discussing what happened in the futures and  
24 securities markets that afternoon.

Next I, with the help of Gregg, Jonathan and David,

1 will summarize the preliminary findings from the securities  
2 side of the markets, and then Steve will summarize the  
3 preliminary findings from the futures side, and then we'll  
4 have some time reserved to take your questions regarding  
5 these preliminary findings.

6           And then in the second half of the morning, we will  
7 talk about next steps and analysis both on the securities and  
8 the futures and through joint collaboration.

9           Before we begin on the preliminary findings, I  
10 think it might be worth making one caveat. The investigation  
11 into these events is continuing, and the joint report that we  
12 prepared for you was able to capture only our preliminary  
13 findings within a relatively short period of time.

14           In addition, as we'll discuss a little bit more  
15 later, the reconstruction of the relevant events is  
16 complicated by the enormous amount of data involved, which is  
17 being compiled on the securities side from multiple sources  
18 that do not have a consistent framework for collecting,  
19 formatting, and structuring data regarding quote and trade  
20 activity, all of which is to say that we need to keep in mind  
21 that the information we're presenting today is subject to  
22 change as we validate and correct data that we have and  
23 incorporate new data into our analysis.

24           So with that, let me turn it over to Steve to give

25 us some general context on the market.

1 MR. SHERROD: Thanks, Robert.

2 Throughout the day on Thursday, May 6th, many  
3 financial news outlets were reporting on political and  
4 economic events that were creating uncertainty in the  
5 financial markets. As reports highlighted the perceived  
6 increased risk of default of certain European countries,  
7 there was downward pressure on the euro in global currency  
8 markets. We particularly note the European Central Bank held  
9 a press conference and did not address the possibility of  
10 purchasing Greek government bonds.

11 This raised concern over defaults, as reflected in  
12 an increase in the price of premiums on credit default swaps  
13 to protect against such events.

14 Throughout the day we also observed a broad decline  
15 in the U.S. equity market as all major broad based equity  
16 indices and equity index futures contracts spent much of the  
17 morning and early afternoon in negative territory. This  
18 decline in equity markets coincided with a rise in expected  
19 volatility as captured by the rise in the CBOE S&P 500  
20 volatility index, usually referred to as the VIX.

21 Prior to May 6th, the VIX in 2010 had averaged  
22 about 20, indicating a relatively low level of expected  
23 market volatility as compared to the levels that prevailed in  
24 2008 and 2009. On May 6th, however, the VIX began the day at

25 about 26 and reached levels of about 40 during the day.

1           Beyond the effect that economic news was having on  
2 credit and equity markets, there was also evidence of a  
3 flight to quality as investors sought to extract funds from  
4 perceived risky investments and to place them into what are  
5 viewed as safer investments, such as U.S. Treasuries and  
6 gold. This is evidenced by the fall in the ten-year Treasury  
7 yield from a level of 3.58 percent on May 5th to an intraday  
8 low of 3.26 on May 6th, before settling at 3.41 for the day.

9           Gold prices, which normally rise in times of market  
10 uncertainty, rose on the COMEX where the nearby gold futures  
11 contract went from approximately \$1180 per ounce at the  
12 opening to \$1210 per ounce at the 1:30 p.m. Eastern time  
13 close.

14           In addition to the flight to quality, global  
15 currency markets were indicating concern over the European  
16 Union. Shortly after 1:00 p.m., the euro began a sharp  
17 decline against both the U.S. dollar and the Japanese yen.

18           CO-CHAIR GENSLER: Just for those on the phone,  
19 we're looking at Slide 6. If you might mention.

20           MR. SHERROD: Sure, sure. Moving on to Slide 7,  
21 during the afternoon on May 6th, staff observed continued  
22 pressure in the market, and equity prices continued to  
23 decline, along with the increasing expectations in the market for  
24 the VIX for volatility.

Between 2:00 and 2:30 p.m., there was an increase

1 in the number of liquidity replenishment points or LRPs  
2 triggered in the NYSE's trading system. These LRPs are  
3 intended to dampen volatility by triggering what is known as  
4 a go slow period of trading where additional liquidity is  
5 allowed to enter the market. My colleague will discuss LRPs  
6 further in his testimony about findings in the securities  
7 markets.

8           The existing market decline accelerated and implied  
9 volatility sharply increased. By approximately 2:45 p.m.,  
10 over 200 securities had fallen 50 percent or more from their  
11 2:00 p.m. levels. Between 2:45 and 2:47 p.m., the Dow, S&P  
12 500, and NASDAQ 100 all reached daily lows.

13           During that same period, all 30 Dow components  
14 reached their intraday minimum, representing a range from 4  
15 to 36 percent below their opening levels. The Dow bottomed  
16 at about 9872, the S&P at about 1065, and the NASDAQ at  
17 about 1752. The E-mini S&P 500 index futures contract, the  
18 June 2010 contract, bottomed at 1056.

19           There were also instances of securities exchanges  
20 declaring self-help against another exchange. A declaration  
21 of self-help freed the declaring exchange from their  
22 obligation to route orders to the affected exchange, and  
23 again, my colleague will discuss self-help further in his  
24 presentation.

1 events, signals from various other markets, and a market  
2 increase in sell orders in comparison to buy orders in the  
3 limit order book suggest that a significant dislocation of  
4 liquidity in the E-mini S&P 500 futures contract may have  
5 occurred.

6           After bottoming, equity and equity index futures  
7 markets began to rebound. At 2:50 p.m., the Dow was trading  
8 at 10,232, and the E-mini S&P 500 was trading at 1,096. The  
9 E-mini futures contract climbed further. By 2:53 p.m., it  
10 was at 1,118, and the Dow closed at 10,520, down more than  
11 347 points, or 3.2 percent from the prior day's close. The  
12 E-mini settled at 1,122, or down about 41.5 points from the  
13 prior day's close.

14           And we'll turn to the next slide with Robert.

15           MR. COOK: Thanks, Steve.

16           We'll now zero in a little more closely on the  
17 preliminary findings presented in the report with respect to  
18 the securities markets. The events of the afternoon of May  
19 6th with respect to the securities markets can usefully be  
20 described in terms of two broad but related themes. The  
21 first is a precipitous drop of the major securities indices,  
22 as Steve just noted, of more than five percent, followed  
23 immediately by a rapid recovery, which occurred consistently  
24 across various broad indices and products.

The second are the even more extreme price

1 fluctuations, mostly losses, that occurred for certain  
2 individual securities which were followed relatively promptly  
3 by reversions to the price levels consistent with the broader  
4 market.

5           Moving on to Slide 10, for those of you who can't  
6 see the presentation, and zeroing in a little bit more on  
7 the graph showing how the indices moved during that  
8 day and to just kind of go through the key hour period where  
9 we're going to be focusing most of our attention this  
10 morning.

11           So up until about 2:30, there was a significant but  
12 not extraordinary down day that was consistent with many of  
13 the economic factors that Steve just reviewed, but then the  
14 market decline began to steepen. At approximately 2:40,  
15 prices declined with extraordinary velocity.

16           By the way, we use 2:40 p.m. a lot in this  
17 presentation because it's a useful benchmark for the market  
18 prices just before the steep market decline. So you'll often  
19 hear us referring to 2:40 p.m.

20           So by 2:42, the Dow is down 3.9 percent. It then  
21 suddenly dropped 573 points, which was an additional 5.49  
22 percent, in just five minutes of trading, and you can see  
23 that spike downward there. By 2:47, it was down 9.16 percent  
24 from the previous day's close.

The market then suddenly and dramatically reversed

1 itself, recovering 543 points in about a minute and a half.  
2 By 3:00 p.m., the Dow was down 4.26 percent, and it ended the  
3 day down 3.2 percent. And as you can see from this slide,  
4 there are similar patterns occurring with respect to the S&P  
5 500 index.

6           So while the overall market had a significant down  
7 day, the closing numbers don't really tell the full story of  
8 these dramatic moves down and then up during the 20 minutes  
9 of trading in the mid-afternoon. Understanding the trading  
10 activities that contributed to these plunge and recovery, as  
11 well as the market structures that permitted it, are  
12 obviously crucial areas for further analysis.

13           In this regard, one of the key areas we're focusing  
14 on is the linkages between the cash and the futures market.  
15 As indicated in the graph, the precipitous decline in stocks  
16 and their subsequent recovery correlated very closely with a  
17 drop in recovering the value of the E-mini S&P 500 future  
18 contract. In a sense, this basically reflects basic market  
19 dynamics since much of the price discovery in the broader  
20 stock market can occur in the futures markets and traders who  
21 believe that one market is overpriced might sell in the other  
22 market and/or buy in the other market if they believe the  
23 other market is underpriced.

24           So given that the E-mini price fell by more than

25 five percent in five minutes and then quickly rebounded after

1 the CME stop logic functionality was triggered, which Steve  
2 is going to get into more later, it really isn't surprising  
3 that the broader stock market indices showed similarly fast  
4 and similarly large declines and recoveries, but of course,  
5 the fact that the two moved together doesn't tell us exactly  
6 what triggered the price movements.

7           Steve will be speaking later about some of the  
8 potential sources of selling pressure in the E-mini contract  
9 that came during that vulnerable time. I'll be talking later  
10 about some of the potential sources of selling in the  
11 securities markets. But I think the key point here is the  
12 linkages between the two markets and understanding how one  
13 affected the other because of the potential impact that can  
14 occur when a trigger occurs in either markets, the follow-on  
15 effects for the other market.

16           Moving to Slide 11, this just gives you some of the  
17 numbers more precisely for the percentage daily lows relative  
18 to the prior day's close. As you can see, each index or  
19 product reached its daily low between 2:45 and 2:47 and then  
20 recovered over the course of the day to a level higher than  
21 their 2:40 p.m. values.

22           Note that the daily decline for the Dow was less  
23 than ten percent, which is the first trigger for the existing  
24 market-wide circuit breakers. So even if the Dow had gone

25 below ten percent during this time, because it was after 2:30

1 p.m., that would not have triggered the existing circuit  
2 breakers. The Dow would have had to go down 20 percent after  
3 2:30 p.m. in order to trigger the first halt under existing  
4 market-wide circuit breakers.

5 We go to Slide 12. This slide helps demonstrate  
6 the impact of the market declines on the individual  
7 securities. It's a scatter plot representing the lowest  
8 transacted price for a given stock on May 6th. Each dot  
9 represents one stock, and the low return is calculated from  
10 the previous day's close.

11 Most securities, about 86 percent, stayed within  
12 ten percent of their 2:40 p.m. price. You can see a red dot  
13 for the low in the S&P 500 just above the minus ten percent  
14 line. Approximately 14 percent of securities reached lows  
15 that exceeded ten percent of their 2:40 p.m. price.

16 You'll see a significant number of stocks had a low  
17 transaction for the day well before the market instability.  
18 These low transactions increased as you moved to the right  
19 over the course of the day, but at about 2:45, there's a wave  
20 of low trades as seen in the large blue mass at the bottom.  
21 This cluster reflects a significant number of transactions  
22 that occurred at prices close to zero, which may have  
23 resulted from executions against stub quotes.

24 We'll be talking quite a bit about stub quotes

25 today, and it's discussed in the report. Stub quotes refer

1 to quotes that are posted by a market maker in order to  
2 satisfy the requirement to make a two-sided market, but  
3 because the market maker is unwilling or unable to provide  
4 liquidity at the time, it puts up quotes at such a low or  
5 high prices, such as a penny or \$100,000, that they are not  
6 really intended to be executed.

7           We have highlighted in this chart two stocks, A and  
8 B, which we'll examine a bit more closely in a few minutes.  
9 Stock A suffered a significant decline, and Stock B traded  
10 at levels close to 100 percent loss.

11           If we move to Slide 13, this table helps describe  
12 the lows during the "hot" period from 2:40 to 3:00 p.m. You'll  
13 see approximately seven million trades occurred during this  
14 time for almost two billion shares. Note that almost 70  
15 percent of trades were executed for a loss relative to the  
16 2:40 p.m. price. The bulk of the trades, almost 98 percent  
17 of the loss, of the loss trades, or 69 percent of all trades,  
18 were executed within ten percent of their 2:40 p.m. price.  
19 Thus, the largest overall losses occurred within the ten  
20 percent range, which is not too surprising, given that the  
21 indices as a whole bottomed out just above the ten percent  
22 loss level.

23           But this does highlight the importance of  
24 addressing the issues that caused the precipitous plunge and

25 recovery of the broader indices. Even if we do not have

1 other securities whose value tumbled down to zero, as  
2 reflected in the histogram you just saw or the scatter plot  
3 you just saw, the losses to the securities track the index  
4 were still enormous.

5           We're now on Slide 14. This scatter plot  
6 represents the highest transacted price for a given stock for  
7 the day, where that price had highs above zero relative to  
8 the prior night's close. Note that there are far fewer  
9 positives here than there were negatives in the scatter plot  
10 we saw moments ago in the left-hand side of the chart, but  
11 you can see a mass starting at around 2:43 p.m.

12           In addition, a small number of stocks transacted at  
13 even higher prices. We've identified five stocks that  
14 transacted at \$100,000 per share. Again, these are likely  
15 the result of executions against stub quotes.

16           Unlike in the scatter plot for the daily lows in  
17 which there are several extreme lows occurring throughout the  
18 day prior to 2:40, here there do not appear to have been any  
19 extreme highs prior to about 2:44 p.m.

20           I would like to just sort of zoom in even closer on  
21 a couple of selected securities so you can get a sense for  
22 what was happening at the time, and Gregg is going to walk us  
23 through two selected stocks, and we're now on to Slide 16 in  
24 your materials.

MR. BERMAN: Thanks, Robert.

1           I'll draw everybody's attention to Slide 16, which  
2 shows 90 seconds of trading for a particular large cap stock.  
3 The first thing to notice is what's not on this graph,  
4 namely, the S&P low or the Dow Jones low. This is occurring  
5 at about 2:47, which is a full two minutes after the lows of  
6 the major market indices. The graph is constructed to show  
7 the range of trading and how that trading fits into the bid  
8 and asks that were occurring during this 90 second period.

9           The red thick line at the bottom of the trading  
10 range represents over each second the absolute worst national  
11 best bid. So during a second period we should see a range of  
12 bids and this one represents the worst. Hence we should not  
13 expect to see trades below that.

14           Similarly, on the up side we have the green line,  
15 which represents the absolute best offer during a second  
16 period across all exchanges, and we should not expect to see  
17 trades above that. The first thing to notice is that as the  
18 stock began to decline, we do see some trades that spike  
19 above the green line. Whether or not those are artifacts of  
20 timing or those are actual trade-throughs remains to be seen  
21 and requires further investigation.

22           The more interesting part is on the decline, which  
23 started at about 2:47 and continues for about 15 seconds  
24 before hitting the lows. What we see is that the trades did

25 not break through or trade through the lowest bids, but that

1 the rapid decline in price truly represents a dry up of the  
2 liquidity and the collapsing of the bid prices themselves.

3 We had trades that went from the bid to the offer  
4 and back and forth within a one second period of time. The  
5 offer side collapsed about where the lows are, and you can  
6 see that in the green dot, the green line collapsing in the  
7 middle, and we also see some trade-throughs or potential  
8 trade-throughs at that time.

9 As quickly as the stock fell, the bids immediately  
10 climb after hitting the low. The trades follow up the red  
11 line. The bid-ask spread narrows, and by the end of the 90  
12 second period we actually have a recovery that is greater  
13 than the initial loss to begin with. So all of this happens  
14 in a minute and a half, and part of the next step of our  
15 research is to understand better how the bids themselves  
16 collapsed which we are not able to see on this particular  
17 chart.

18 Now, this represents an example of a stock that had  
19 a very large decline, but did not fall all the way to zero.  
20 In the next example, on Slide 17, we see a dramatically  
21 different picture. This stock starts off with a tight  
22 bid-ask at just before 2:48. Again, this is after the market  
23 has declined and while the broad market itself is on the  
24 rebound. And for reasons which we still need to explore, the

25 bid side completely collapses in a five second period.

1           During that five second period, we see trades at  
2 \$20. This was the stock that was priced \$40 five seconds  
3 previously. We have within the same second trades going at  
4 \$7, \$5 and \$32 at the offer side. So all of this is within a  
5 one second period of time.

6           Finally, by the time you get to 2:47 and 51  
7 seconds, we see that the bid side has collapsed to zero and  
8 that there are actually trades being executed at those  
9 prices. Now, this, again, is important because this does not  
10 mean that see bids that are going through or trades that are  
11 going through the bid-ask. There is a matching mechanism by  
12 which someone had to trade in and was agreeing to sell for a  
13 penny. Somebody had to trade in and was agreeing to buy for  
14 a penny.

15           Whether or not that was an intention or was that a  
16 ramification of the way the systems and possibly stop orders  
17 worked remains to be seen, but the market nevertheless stayed  
18 for a full ten seconds or so at stub quotes of a penny or  
19 more, and again, as rapidly as it collapsed, it automatically  
20 rose again. After 2:48 we see a few trades that are still at  
21 stub quotes that may not have caught up with the rising  
22 bid-ask, and then by 2:48 and 5 seconds, we see that the  
23 bid-ask spread comes back to pre-collapse levels, even though  
24 you'll notice that there are actually no trades during that

25 period of time. So even though there is very, very little

1 activity for the last ten seconds or so of this slide, the  
2 bid-ask spreads and the quotes have retained normal level.

3 MR. COOK: Thanks, Gregg.

4 I think it's important to emphasize that these are  
5 just two examples of experiences of two particular stocks.  
6 The first stock was a component of the Dow and the S&P 500.  
7 The second stock that went down to penny trades is a  
8 component of the Russell 1000 index. There are many  
9 obviously different stories with respect to each different  
10 stock, and I didn't want this to suggest that there's only  
11 two patterns at play here. There are many different patterns  
12 that we've observed, but it helps to show the decline in a  
13 stock that declined significantly, but eventually recovered  
14 before it hit bottom, and in Stock B a stock that went all  
15 the way down to penny trades within a very short period of  
16 time.

17 So now we'll talk a little bit about broken trades.  
18 If you look at Slide 19, we have the table that we had shown  
19 you before on the distribution of low trades relative to the  
20 2:40 p.m. price. We've highlighted near the bottom here the  
21 trades that were eventually broken pursuant to exchange  
22 rules. So after the trading day on May 6th, the exchanges  
23 determined to break all trades between 2:40 p.m. and 3:00  
24 p.m. that executed at prices different, up or down, from the

25 2:40 -- sorry -- prices 60 percent or more away up or down

1 from the 2:40 p.m. price.

2           The exchanges do this pursuant to their clearly  
3 erroneous execution rules that are designed to permit them to  
4 cancel trades that in their determination were clearly  
5 entered into in error.

6           Of the broken down trades, the bulk transacted at  
7 prices 90 percent or more from their 2:40 p.m. price, as you  
8 can see at the bottom row on the table. The overall market  
9 value of the shares involved in the broken trades was, of  
10 course, small due to the artificially low share prices  
11 involved. But the shares involved in these trades would have  
12 been valued at 212 million if we used their 2:40 p.m.  
13 benchmark price.

14           If we move to Slide 20, in this figure, we show the  
15 time distribution of the broken downward trades. This sample  
16 includes all trades identified by the exchanges as broken.  
17 So we show some small number of broken trades that occurred  
18 outside of the 2:40 to 3:00 p.m. time frame. But most of the  
19 broken trades transacted between 2:45 and 2:55. There were  
20 about 11,400 or so broken trades between 2:45 and 2:50 and  
21 about 4,700 broken trades between 2:50 and 2:55.

22           You remember from the scatter plot that we showed  
23 earlier a significant number of these broken trades, about 43  
24 percent, were at stub quote prices, here identified as less

25 than a nickel. Stub quote executions occurred in more than

1 200 securities, including large, medium, and small cap  
2 issuers, but with a concentration in small cap issuers, which  
3 would be consistent with the tendency of these stocks to have  
4 less liquidity and thus a greater likelihood that sell  
5 interest could overwhelm order books in times of heightened  
6 volatility.

7           If we move to the next Slide 21, we received  
8 information about short sale trades from the exchanges and  
9 FINRA. They provided us with a flag for each broken trade  
10 that was identified as a short sale, and here we've laid that  
11 information on top of the same table. So for the critical  
12 ten minutes, 2:45 to 2:55, short sales appear to represent an  
13 important fraction of trades executed at prices below a  
14 nickel. Shorts appear to represent about 70 percent of the  
15 trades from 2:45 to 2:50 and 90 percent of the trades between  
16 2:50 and 2:55, not all trades, but we're talking about about  
17 the stub quote trades.

18           While this analysis is very preliminary and we have  
19 not been able to verify the accuracy of the data we have  
20 received, this phenomenon is something we will study closely.  
21 We need to understand any role that short selling played more  
22 generally in connection with the market decline.

23           We can speculate that these trade were the result  
24 of short sale market orders, but they could not bid a bid

25    above a nickel. We can also speculate that the parties would

1 not have intended to sell short at these low levels. Note  
2 that the short sale executions against stub quotes at or  
3 below the national best bid would have been subject to the  
4 alternative uptick rule that was adopted by the Commission  
5 early this year, but won't be effective until November 10th  
6 of 2010.

7           If we look at the next Slide 22, we can talk a  
8 little bit about the types of securities that had broken  
9 trades. This table is also based on data provided by the  
10 exchanges and FINRA. All told, there were 326 securities  
11 affected. Of these stocks, 56, or about 17 percent, were  
12 primarily listed on the New York Stock Exchange; 225, or 69  
13 percent, were primarily listed on Arca. No doubt, stocks had  
14 broken trades. About 12 S&P 500 stocks had broken trades and  
15 30 stocks in the Russell 2000 were broken.

16           Remember that this doesn't mean that there were no  
17 serious losses in these other categories, just that the  
18 trades in those other categories were within the 60 percent  
19 threshold established for determining whether the trade would  
20 be broken.

21           Importantly, about 227, or almost 70 percent of  
22 stocks with broken trades, were ETFs. The 99 securities with  
23 broken trades that were not ETFs include securities of a wide  
24 range of issuers both large and small, and there may be a

25 range of explanations for their aberrant behavior.

1           But we'll spend a moment now to look a little bit  
2 more closely at the experience of exchange traded funds. I'm  
3 going to turn it over to Jonathan to walk us through these  
4 slides. We are now on Slide 24.

5           MR. SOKOBIN: Thank you, Robert.

6           So 69 percent of the securities of the stocks that  
7 experienced a broken trade were ETFs. A large number of ETFs  
8 traded for a short period of time with very significant  
9 intraday price swings. Twenty-five percent had temporary  
10 price declines of more than 50 percent from their 2:00 p.m.  
11 market price.

12           Slide 24 is the same scatter plot that you saw  
13 earlier on Slide 12, but now only for the ETFs. There are a  
14 couple of features here that are worth noting. We see little  
15 evidence of the same pattern of increasing daily lows prior  
16 to the 2:33 -- excuse me -- 2:43 to 2:45 period. Instead  
17 there's a significant to the ETF sector that hits around  
18 2:43, 2:45, and continues on all the way to 3:00 p.m.

19           Ninety-six percent of ETF shares that traded below  
20 the 2:40 price traded at prices above or within the ten  
21 percent level of their 2:40 p.m. price, but approximately 160  
22 ETFs experienced lows for the day that were almost 100  
23 percent lower than their May 5th close.

24           Although we don't show the chart, the analogous

25 chart for the trades of -- excuse me -- the high point of the

1 trades exclusively for the ETFs, we know that a number of  
2 those highs were also ETFs with one ETF experiencing a daily  
3 high of 275 percent above the May 5th close.

4 I'd ask you to turn to Slide 25. This slide, this  
5 figure shows different categories of ETFs that had broken  
6 trades and the proportion of ETFs in each category that  
7 experienced broken trades. The 227 ETFs with broken trades  
8 were in 838 ETFs. This chart only reflects ETFs and ETF  
9 categories for which there were broken trades.

10 There is no evidence that there is a pattern in  
11 ETFs, particularly around bond ETFs or ETFs that are focused  
12 in areas that are unrelated to the broad market, and in fact,  
13 there appears to be at least some weighting toward ETFs that  
14 invest in large cap stocks. But we haven't investigated that  
15 particularly closely yet, and it's one of the areas that we  
16 tend to look in.

17 If you'll turn to Slide 26, this is a sample  
18 trading period for an exchange traded fund. This is a large  
19 fund that is designed to match the total stock market  
20 exposure. This graph shows a period of 16 minutes, and I  
21 would point out that you can see between 2:45 and 2:46 is the  
22 point where the S&P 500 hit its low. That point, the spread  
23 between the national best bid and national best offer remains  
24 fairly tight, and as the stock experiences a lowering, a

25    downgrade in the price, that NBBO remains fairly tight.

1 Things look fairly normal until about between 2:45 and 2:46.

2           At that point the ETF appears to hit a shock where  
3 the bid drops from about \$50 to about \$30 and then returns  
4 quickly, and you can see by the mass of blue within the green  
5 and red bars that there is significant trading within that  
6 period.

7           The stock rebounds and recovers until a few, less  
8 than a second later, and then all of a sudden another shock  
9 hits, and the bid drops again. And at this point there is a  
10 transaction at a low price of 15 cents below the national  
11 best bid. And even as quickly again, as Gregg had said, as  
12 quickly as the bid price drops it returns, and the spread  
13 between the national best bid and national best offer return  
14 to a spread that seems to be normal for this security.

15           MR. COOK: Thanks, Jonathan.

16           Again, that's just one sample ETF, and there are  
17 many different patterns when we drill down on the other ETFs  
18 that had significant aberrations in their trading. We're  
19 going to be talking more later about what some of the  
20 theories might be for why ETFs behave this way.

21           Continuing with our observations of what happened,  
22 we wanted to talk a little bit about the liquidity issues,  
23 and starting with a discussion about the LRPs, or liquidity  
24 replenishment points, and the self-help issues that Steve

25 alluded to earlier. And I'm going to turn it over to Dave

1 Shillman to talk about this a little bit.

2 MR. SHILLMAN: Okay. Well, thanks, Robert.

3 I think I'd like, as Robert said, I'd like to talk  
4 about two unique aspects of the U.S. equity markets that  
5 we're examining to see whether or not they contributed to the  
6 price declines we saw on May 6th.

7 As many of you know, you know, there are many  
8 different places to trade stocks in the U.S. market. There  
9 are about ten or so exchanges, many times that more  
10 alternative trading systems, and many times more market  
11 makers, a multitude of venues. But our regulatory framework  
12 brings those multiple venues together through consolidated  
13 market data, through private linkages supported by fair  
14 access requirements and through a trade-through rule that  
15 generally prohibits trades at a worse price and the best  
16 displayed price.

17 And in the report, we look at whether certain  
18 practices that have developed in this national market system  
19 contributed to the events of May 6th and whether or not they  
20 exacerbated the price declines we saw.

21 The first of these are the New York Stock Exchange  
22 liquidity replenishment points, and today trading in the U.S.  
23 markets generally is automated and very fast, but the New  
24 York Stock Exchange has retained a volatility moderator for

25 its market known as the LRP where it will go slow when an

1 incoming order would result in an execution materially away,  
2 generally one to three percent, from the last sale. During  
3 this time, which can last from a second or less to several  
4 minutes, the New York Stock Exchange seeks to attract  
5 liquidity and then reopen in a way that moderates price  
6 volatility on its market.

7           When the New York Stock Exchange does this,  
8 however, the buy orders on the NYSE's book are unavailable to  
9 sellers wishing to trade immediately, and one of the things  
10 we're looking at is whether the unavailability of the buy  
11 orders on the New York Stock Exchange -- the New York Stock  
12 Exchange now overall is about 15 percent of the  
13 market -- whether that unavailability to those that wanted to  
14 execute immediately, you know, exacerbated the overall price  
15 decline or, alternatively, we're looking at whether the  
16 availability of a mechanism where a seller might get a better  
17 price, actually attracted sell pressure to the New York Stock  
18 Exchange to moderate volatility. So it's an open issue, but  
19 one we've teed up and are going to probe more deeply.

20           The second aspect of the national market that we're  
21 looking at is the self-help remedy, and basically, under Reg.  
22 NMS a market can exercise self-help and not comply with the  
23 trade-through rule if a market appears to be having systems  
24 problems, and as you can see from Slide 28, during the key

25 period on May 6th, four markets, NASDAQ, NASDAQ OMX BX, BATS

1 and NSX, exercise self-help against Arca, which has about 13  
2 percent of the overall market share, for a period that lasted  
3 until towards the end of that half hour.

4           The facts remain in dispute as to  
5 whether that self-help exercise was legitimate or not, but  
6 the fact of the matter is during that period those who were  
7 using the routers provided by those four exchanges did not  
8 have access to the buy liquidity that may have been available  
9 on Arca.

10           So, again, we're looking at the extent to which  
11 self-help against Arca exacerbated the overall price decline,  
12 but again, the unavailability of Arca really would have been  
13 available for those who were using the routers of those  
14 exchanges and anyone else who may have been exercising  
15 self-help against Arca.

16           I think if you move to Slide 29, that gives a  
17 graphical example of how the NYSE's LRPs increased in the  
18 afternoon of May 6th, particularly during the critical  
19 period, and the blue bar on the left is the average number of  
20 stocks that had an LRP event lasting more than a second, and  
21 that average is based on activity during the course of 2010.

22           On the right in the red bar are the numbers that  
23 occurred on May 6th, and you can see that starting at around  
24 1:00 the number of stocks impacted by LRPs started to

25 increase above the historical norms, with a significant

1 increase occurring around between 2:00 and 2:30, and then a  
2 huge jump during the, you know, core hot period from 2:30 to  
3 3:00, where over 1,000 securities on NYSE were impacted by  
4 one or more LRPs, and then it gradually started to decline  
5 over, of course, the rest of the day.

6 So, again, this is a phenomenon where we're going  
7 to be looking at more deeply to determine whether or not it  
8 had detrimental impact on the volatility on May 6th.

9 MR. COOK: Thanks, David.

10 Just a note that these bars show the number of  
11 stocks impacted. They don't necessarily show how long they  
12 were impacted. It could have happened for a second or  
13 multiple seconds.

14 The other thing is that on the self-help  
15 declarations that were shown on the previous slide, just to  
16 note that those were in the equity markets. There are some  
17 conflicting reports about potential self-help claims in the  
18 options markets that we're going to continue to look into.

19 So continuing with our discussion of liquidity, if  
20 we move to Slide 30 we see a portrayal of the volume activity  
21 between 2:00 and 3:00 p.m., and you see the increase in  
22 trading that appears as the broad market experiences a  
23 disruption and then fails.

24 I would just note Jonathan is going to talk a

25 little bit more about liquidity, but there's an enormous

1 volume of trading on this day, 2.2 times the average daily  
2 trading volume in the fourth quarter of last year. So May  
3 6th had the second highest daily volume for New York Stock  
4 Exchange listed stocks across all trading venues. The  
5 markets processed more than ten billion shares in New York  
6 Stock Exchange stocks alone, and May 6th had the highest  
7 daily volume on record for all NASDAQ listed stocks across  
8 all trading venues.

9           We'll discuss some of the consequences of this  
10 again further, but just to again flag that this high volume  
11 of trading result in billions of data elements, millions of  
12 trades and thousands of securities, all executed in  
13 milliseconds which all contributes to the complexity of  
14 trying to recreate what happened here.

15           Jonathan, do you want to talk some more about  
16 liquidity?

17           MR. SOKOBIN: Thank you, Robert.

18           If you'll turn to Slide 31, one of the important  
19 questions that the staff has been asked to address is whether  
20 electronic liquidity providers pulled back during the  
21 relevant time frame. The activities of these electronic  
22 liquidity providers are important because they've come to be  
23 a dominant type of liquidity provider in equity markets. Some  
24 estimates suggest that high frequency traders are 50 percent

25 of the total volume or higher. Individual firms can enter

1 large numbers of orders that can execute more than a million  
2 trades a day. In order to get a better sense of the role  
3 that these liquidity providers play, we asked the exchanges  
4 to identify the top ten liquidity providers on that exchange.  
5 For each of these top liquidity providers the exchanges  
6 reported the total number of shares provided or taken by each  
7 firm.

8           Liquidity provider for these purposes would provide  
9 executable quotes. A liquidity taker would lift or hit a  
10 resting bid by each firm.

11           What Slide 31 shows is the percentage of shares  
12 traded. The blue line is the number of shares traded. The  
13 green line is the percentage of that volume that the top ten  
14 liquidity providers accounted for, that they were providing.  
15 So that is the percentage of shares traded where the  
16 liquidity provider was being hit, was not initiating the  
17 trade.

18           The red line below it is for the same top ten, is  
19 the percentage of shares traded at any given time for which  
20 they were the liquidity taker. All right? So the difference  
21 between the two is the extent to which these liquidity  
22 providers were net providers of liquidity over the period  
23 2:00 to 3:00 p.m.

24           What we see here is because the green line is above

25 the red line at all times, that the top ten liquidity

1 providers were, in fact, net liquidity providers across that  
2 entire hour. And, in fact, sort of a simple test looking at  
3 it with your eyes, not a formal statistical test, it seems to  
4 be that these providers effectively provided the net same  
5 number of shares throughout the hour. So even in the period  
6 where volume spikes, these providers continue to provide  
7 approximately the same proportion of share volume and take  
8 approximately the same proportion of share volume that they  
9 do throughout the hour.

10 But we have to be very cautious interpreting this  
11 figure. It only measures liquidity provision with respect to  
12 shares and not the prices at which the liquidity was  
13 provided. For instance, if most of the liquidity provided  
14 during this critical period was at stub quotes, we would not  
15 easily conclude that the liquidity providers were dampening  
16 the market volatility during the period.

17 Moreover, anecdotal evidence provided to us through  
18 interviews with market participants suggest that, in fact,  
19 some major liquidity providers ceased providing liquidity  
20 during this period. All of this says that this graph is only  
21 the beginning of the analysis that needs to be done and  
22 points us in the direction of one of the lines of inquiry  
23 that we'll be taking.

24 MR. COOK: Thanks, Jonathan.

Just to underscore that point, obviously these are

1 average numbers, and one of the things we're engaged in now  
2 is looking with more granularity at the activities of  
3 particular liquidity providers, to focus on whether certain  
4 firms who were normally liquidity providers became liquidity  
5 takers and at what volumes, and I think we'll see some  
6 interesting behavior there that we will point out to you as  
7 we get the analysis complete on that front.

8           So that is at a very high level some of the factual  
9 findings on the securities side, and we'll now turn it over  
10 to Steve and his colleagues to talk about the futures side.

11           MR. SHERROD: Okay. Thank you Good.

12           MR. ENGLE: Hello. Can I say hello, that I've just  
13 arrived? This is Rob Engle.

14           CO-CHAIR SCHAPIRO: Thank you very much. We will  
15 be starting on Slide 33 if you have the slide deck with you  
16 that we e-mailed over the weekend.

17           MR. ENGLE: I do have it. Thank you.

18           CO-CHAIR SCHAPIRO: Great.

19           MR. ENGLE: I will be ready in a second. Thank  
20 you.

21           MR. SHERROD: And, again, this is Steve Sherrod  
22 from the CFTC. We're on Slide 33.

23           CFTC staff conducted a preliminary analysis, and I  
24 want to emphasize like Robert did earlier this is our

25 preliminary analysis, and we reviewed the activity of the

1 futures markets to better understand the events that took  
2 place on May 6, 2010. The objective was to collect, analyze  
3 that preliminary evidence that we had that might be  
4 associated with possible causes of the events that occurred  
5 in futures markets, including, but not limited to, erroneous  
6 activities, such as fat finger errors, cyber attacks and  
7 significant system malfunctions.

8           Staff's preliminary review has not at this time  
9 found evidence of erroneous activities, no evidence of cyber  
10 attack, and likewise no evidence of significant system  
11 malfunctions. Rather, our preliminary findings suggest that  
12 a confluence of economic events, signals from various other  
13 markets, and a market increase in sell orders culminated in a  
14 significant liquidity dislocation in the E-mini S&P 500  
15 futures contract. This liquidity dislocation was also  
16 preceded by some reduction in activity of certain liquidity  
17 providers.

18           I'll discuss our review of the role of liquidity  
19 and the return to a balance in trading coinciding with  
20 triggering of a pre-trade automated safety feature which the  
21 CME calls Globex stop logic functionality.

22           Turning to Slide 34, our review focused on trading  
23 the liquidity provision in the June 2010 E-mini S&P 500  
24 futures contract. That single contract in the E-mini S&P 500

25 comprised 78.2 percent of the total trading volume in the 12

1 most actively traded broad based stock index futures  
2 contracts on May 6, 2010. An apparent imbalance of orders on  
3 the sell side, of course, resulted in falling prices.

4 At the bottom of the price decline, the depth of  
5 the order book declined, the price incline induced buyers we  
6 believe to enter the market, and the bottom of the price  
7 decline coincided with that CME Globex stock logic event.

8 Thirty-five.

9 Consistent with the broad market trends on May 6,  
10 2010, trading volume in the E-mini S&P 500 futures was about  
11 2.6 times greater than the average daily trading volume over  
12 the prior month. On May 6th, trading volume in the S&P  
13 E-mini contract was the fifth highest daily volume over the  
14 past five years.

15 Furthermore, the contract experienced a  
16 significantly higher level of trading during certain  
17 concentrated periods of the day. In addition to the overall  
18 high daily volume, intraday period by period trading volumes  
19 significantly exceeded the average trading volume for the  
20 same intraday periods observed over the prior month,  
21 especially between 2:00 p.m. and 3:30 p.m., with a spike in  
22 volume between 2:40 and 2:49 p.m.

23 As noted earlier this high volume was accompanied  
24 by high priced volatility. The daily price range in the

25 E-mini S&P 500 was 112-3/4 points. This represents the

1 second widest price range for the day over the past five  
2 years. The other four of the top five widest price ranges  
3 over these past five years occurred during the financial  
4 crisis in autumn of 2008, including the single largest daily  
5 price range, 115-1/2 points on October 28th, 2008.

6           Within the trading day, the widest price range  
7 between high and low prices calculated over ten minute  
8 intervals was 59-3/4 points. That occurred between 2:40 and  
9 2:49 p.m., and that coincided with the spike in volume.

10           Turning to Slide 36, this is Figure 29 from the  
11 report. The blue bars represent trading volume for ten  
12 minute intervals on May 6th, and the red bars represent the  
13 average trading volume for the prior month. The volume spike  
14 clearly occurs in the 2:40 to 2:49 time period.

15           The tan vertical lines with bar stops, those  
16 represent the price range in the ten-minute intervals and,  
17 again, the graph shows the largest price range of 59-3/4  
18 points during the same time interval as the price spike.  
19 According to the CME, over 250 Globex executing firms were  
20 active in routing E-mini S&P 500 futures contracts orders  
21 into Globex during the hour beginning at 2:00 p.m.

22           Globex executing firm is an entity that is directly  
23 connected into Globex. Non-Globex executing firms access  
24 that trading platform through a Globex executing firm.

Also during this hour of 2:00 p.m., Globex

1 transactions in the E-mini S&P 500 futures were recorded for  
2 6,939 buy accounts, 6,873 sell accounts, 7,669 buy user IDs,  
3 and 7,564 sell user ID.

4 A buy account is a unique Globex account that  
5 executed one or more buy orders, and a buy user ID is a  
6 unique operator ID and also we refer to that as a Tag 50 ID.  
7 That identifies the party who entered the order on behalf of  
8 the account. A Tag 50 ID may be authorized to enter orders  
9 on behalf of multiple accounts, and as well a single account  
10 may have multiple authorized Tag 50 IDs.

11 So to reconstruct the activity is a bit of a  
12 challenge, to say the least. At 2:40 though the E-mini S&P  
13 500 was trading at 1113. Five minutes later at 2:45, the  
14 E-mini had fallen another 57 points and bottomed at 1056.  
15 In the second of 2:45 and 27 seconds, the E-mini S&P dropped  
16 12-3/4 points over a period of a half a second, 500  
17 milliseconds on the sell of 1100 contracts by multiple market  
18 participants.

19 This sequence of trades caused the market to trade  
20 down to an intraday low of 1056. Further, in the bid-ask  
21 spread in the E-mini S&P 500 market widened to 6-1/2 points.  
22 That's 26 ticks. A tick is a quarter point.

23 This triggered the Globex stop logic, and that sent  
24 the E-mini into a reserve state at 2:45 and 28 seconds. The

25 reserve state held execution of any transactions for five

1 seconds. This hold allowed enough orders to flow into the  
2 market so that the next executed trade would be within six  
3 points of the last trade. At 2:45 and 33 seconds, the E-mini  
4 exited its stop logic reserve state. Upon exiting the  
5 reserve state, 1,753 contracts were traded at a price of  
6 1056-3/4. The E-mini began to recover at that point, and in  
7 the single minute of 2:45 p.m volume in the E-mini spiked at  
8 78,412 contracts.

9           So turning to Slide 37, I want to talk a little bit  
10 about the role of liquidity in the E-mini contract. The high  
11 volumes of trading along with sharp price movements suggest  
12 that liquidity at times actually may have dropped off.  
13 Liquidity reflects the ease with which certain amounts of an  
14 asset can be bought or sold without exerting a significant  
15 effect on price. Higher market liquidity can be interpreted  
16 as a greater collective willingness to execute orders at  
17 given prices.

18           While the notion of market liquidity cannot be  
19 directly observed, we can describe it, but we can't directly  
20 observe it. So market liquidity has multiple dimensions that  
21 are hard to capture by a single indicator. Staff at the CFTC  
22 reviewed multiple indicators of liquidity, including but not  
23 limited to the trading volume, the bid-offer spread and the  
24 depth.

With respect to these three indicators, high

1 liquidity may manifest itself as high trading volume. High  
2 volume may indicate the presence of a large number of buyers  
3 and sellers willing to transact in significant quantities. A  
4 narrow bid-offer spread may also be an indication of high  
5 liquidity as it reflects the existence of at least some  
6 buyers and sellers willing to transact at prices close to  
7 recent transaction prices.

8           And finally, the depth of the order book at  
9 successive quotes is an indication of high liquidity in that  
10 it reflects the ability to execute trades of size without  
11 having to bear large price concessions.

12           Turning to 38, so looking at that first indicator  
13 of liquidity trading volume, it did flash some signs of  
14 potentially high liquidity, and that is high trading volume.  
15 In the June 2010 E-mini S&P 500 futures contract during the  
16 period of 2:30 to 3:00, trading volume was about ten times  
17 the average daily volume for the same intraday period over  
18 the prior month. The high trading volume though was  
19 accompanied by significant volatility in the volume. This  
20 suggests to me a dislocation of market liquidity with high  
21 volume fluctuations possibly occurring at the same time that  
22 orders are executed deep into the limit order book, two  
23 indicators, flash signs of low liquidity, but at different  
24 times.

1 logic event, and that was at 2:45 and 28 seconds, and it  
2 briefly became variable, and the imbalance in the order book  
3 with less depth on the buy side was followed -- and that was  
4 at 2:30 -- it was followed by the decrease in market depth  
5 also at 2:45 at the time of the stop logic event. After  
6 that, there was a return to a relative balance between bids  
7 to buy and offers to sell.

8           Turning to Slide 39, it's Figure 30 in the report.  
9 In this figure the red line represents the volume, and the  
10 blue line represents price. The graph displays the level of  
11 volume in ten second intervals between 2:30 and 3:00 p.m.  
12 Between 2:30 and approximately 2:45, volume rose  
13 significantly while the prices fell, and between 2:45 and  
14 3:00, volume fell and prices rose.

15           So transaction volume ranged from several hundred  
16 contracts per second to several thousand contracts per  
17 second.

18           Turning to Slide 40, it's Figure 31 from the  
19 report.

20           We also reviewed the behavior of the bid-offer  
21 spreads for the best and fifth best quotes in the 2:00 p.m.  
22 hour, and in particular, we focused on 2:43 to 2:48 in this  
23 figure. The bid-offer spread is a liquidity indicator based  
24 on the characteristics of a limit order book. Specifically,

25 the bid-offer spread is calculated as the difference between

1 the highest quoted price to buy and the lowest quoted price  
2 to sell.

3 This price difference is a measure of the cost paid  
4 by a buyer or seller who wishes to transact immediately, and  
5 similarly, the second, third, fourth, and fifth best bid and  
6 offer prices represent transaction costs to the buyer and  
7 seller willing to buy at increasingly lower prices and sell  
8 at increasingly higher prices.

9 So the red line here represents the spread between  
10 the best bid and offer, and the blue line represents the  
11 spread between the fifth best bid and the fifth best offer.  
12 The green line is the price of the E-mini contract.

13 Until approximately 2:45 p.m., both spreads were at  
14 their minimums, and that's typically what we would observe in  
15 this market of one tick in the inside bid-offer spread. At  
16 2:45 and 28 seconds, the best bid-offer spread widened to six  
17 and a half points, and at this time the Globex stop logic  
18 triggered a five second reserve state.

19 Following the reserve state, the first and fifth  
20 best quote spreads increased to the period maximum of  
21 approximately two and three-quarter points and eight and a  
22 quarter points, respectively, and that's 11 ticks and 33  
23 ticks. The left-hand scale here is in terms of ticks or  
24 one-quarter of one point.

By 2:50 and 40 seconds, both spreads declined to

1 about one and nine ticks. That's about a quarter point or  
2 two and a quarter points, respectively.

3 Turning to Slide 41, we reviewed the depth of the  
4 market by examining the sum of quantities of orders resting  
5 through the fifth best bid and offer in the limit order book.  
6 At 2:30 p.m. and continuing until shortly after 2:40 p.m.,  
7 significant order imbalances existed between buy orders and  
8 sell orders with significantly more orders in the limit order  
9 book to sell than to buy.

10 In addition, in approximately 2:45 the depth of the  
11 limit order book declined dramatically. But the limit order  
12 book became approximately balanced, that is, orders to sell  
13 became approximately equal to orders to buy, which is a  
14 balanced state for a market to be in. While this relative  
15 balance remained through 3:00 p.m., there was notably less  
16 depth overall in the market.

17 Turning to Slide 42, I've mentioned the pre-trade  
18 automated safety feature on Globex, the stop logic  
19 functionality, and I'll review that in more detail now. This  
20 functionality was originally developed to address both  
21 markets and deferred contract months with low trading volume.  
22 The stop logic functionality is designed to stop a cascade of  
23 stop loss orders, which is essentially an event where one  
24 stop loss order triggers a series of other stop loss orders.

Under the CME rules, this functionality is

1 initiated when the last transaction price would have  
2 triggered a series of stop loss orders that, if they were to  
3 be executed, would have resulted in a cascade in prices  
4 outside a predetermined range called the no bust range. In  
5 this case it's six points in either direction generally from  
6 the last transaction price.

7           On May 6, 2010, that was the first day in 2010 on  
8 which the Globex system activated the stop logic  
9 functionality in any of the equity index futures markets.  
10 The stop loss functionality was activated in the S&P E-mini  
11 at 2:45 and 28 seconds.

12           In a bond being triggered, the E-mini S&P 500 was  
13 sent into what I've referred to as a reserve state. That  
14 reserve state is where the executions are held for five  
15 seconds. This hold allows orders to flow into the  
16 marketplace. If the system can execute within six points of  
17 the last trade, it executes. If the system cannot execute  
18 within that range, then the reserve state would have been  
19 extended for an additional five seconds.

20           At 2:45 and 33 seconds, the E-mini S&P 500 did  
21 execute at a price actually up three-quarters of a point and  
22 exited the stop logic reserve state, and trading continued  
23 throughout the remainder of the day.

24           I'll turn with Slide 43 to my colleague, Andrei, to

25 present some of our large trader analysis.

1           MR. KIRILENKO: So we're now on Slide 43, large  
2 trader analysis.

3           What we've done is that we've looked, in addition  
4 to looking to market-wide measures of liquidity, we have also  
5 looked at account by account trading activity trying to  
6 identify those particular patterns that we can observe in the  
7 way accounts have traded. Specifically, we looked at the  
8 activity in the ten largest accounts by net volume and by  
9 gross volume in order to see whether there were significant  
10 imbalances between large buyers and sellers in the market.

11           We split the critical half hour between 2:30 and  
12 3:00 into two periods, between 2:30 and 2:45, right before  
13 the stop logic functionality kicked in, and 2:46 to 3:00.  
14 And the net volume was computed for each of the accounts in  
15 the E-mini S&P June 2010 futures contract.

16           We noticed that during the period from 2:30 to  
17 2:45, the volume of trading by the top ten net sellers  
18 exceeded that of the net buyers by 20,660 contracts. During  
19 the period from 2:46 to 3:00, the volume of trading by top  
20 ten net sellers, exceeded that of net buyers by 18,364  
21 contracts.

22           Thus, for both periods the trading of the largest  
23 net sellers exceeded that of the largest net buyers in the  
24 market. In this market, for every seller there is a buyer. So

25 what this statistic illustrates to you possibly is that the

1 largest net sellers are selling in the larger lots than the  
2 larger net ten buyers are buying. It doesn't mean that there  
3 are no buyers for the sellers; that the buyers are possibly  
4 buying in smaller sizes, which is consistent with the price  
5 concessions that they may be demanding.

6 Finally, we also noted that one trader out of the  
7 top ten trading accounts only entered orders to sell, which  
8 amounted to approximately nine percent of the volume of the  
9 trading during the period. That trader entered the market at  
10 around 2:32 p.m. and finished trading by around 2:51 p.m.  
11 Thus, the trader sold on the way down and continued to sell  
12 as the price level rose.

13 We now turn to page 44. We've also done a  
14 preliminary analysis of liquidity by examining trading  
15 activity of particular groups of traders in the market in  
16 order to ascertain how these particular groups behaved during  
17 the critical period between 2:30 and 3:00.

18 As we said before, liquidity is something that is  
19 not observable, and liquidity provision has to be  
20 appropriately defined as well. For the purposes of this  
21 analysis, we used the particular methodology to select  
22 significant liquidity providers.

23 What we've done is that we looked at the ten  
24 largest long by gross, by volume accounts and ten largest

25 short gross volume accounts, and from those we selected

1 accounts that were in both categories, that is, they were  
2 both the largest long and the largest short, but their net  
3 position during the period was no more than 150 contracts  
4 long or short. That is, they stayed relatively flat during  
5 this period. They traded a lot, but they didn't accumulate a  
6 net position on either side.

7           We defined this group of six trading accounts as  
8 liquidity providers. In the E-mini S&P 500 Globex electronic  
9 limit order market, there are no designated liquidity  
10 providers. That is, no trader has an obligation to provide  
11 bid and ask quotation on demand.

12           The six accounts that we classified as liquidity  
13 providers participated in about 50 percent of the volume of  
14 all transaction size between 2:30 and 2:34 p.m. For each  
15 transaction there are two sides, the buy side and the sell  
16 side, and so we've computed how many sides these liquidity  
17 providers have taken.

18           The remaining 4,573 accounts of the total of 4,579  
19 transacting between 2:30 and 3:00 p.m. were defined as  
20 liquidity takers. We deliberately made our calculations  
21 robust and biased against us so that we could be reasonably  
22 sure of this preliminary review.

23           So turning now to Slide 45, it's showing the  
24 cumulative volume of transaction size of liquidity providers.

25 The blue line represents liquidity providers as we define

1 them, and the red line represents all of the other trading  
2 accounts during the one-half hour time period.

3 At approximately 2:35 p.m., the liquidity providers  
4 began limiting their trading activity as measured by volume  
5 of transaction size in comparison to liquidity takers. By  
6 2:45:28, liquidity providers accounted for 46 percent of the  
7 volume of all transaction size and by 3:00 p.m., the  
8 liquidity providers account for 41 percent of the volume of  
9 all transaction size.

10 The decline in the participation of liquidity  
11 providers and executed volume of transactions can be  
12 interpreted as a partial withdrawal of liquidity by the six  
13 significant providers during the period of significant price  
14 movement.

15 I'm now going to turn to Rick Shilts, who is going  
16 to present the summary of findings from the CFTC side.

17 MR. SHILTS: Yes, and this would be Slide 46.

18 In summary, CFTC staff review of the futures  
19 markets on May 6th showed that a number of economic events  
20 and market developments led to a broad-based market desire  
21 for investors to lessen their exposure to risky assets. This  
22 translated into a downward movement in prices across  
23 financial markets in conjunction with significant trading  
24 volume.

At or on about 2:30 p.m., evidence suggests that a

1 liquidity dislocation may have occurred in the E-mini S&P 500  
2 futures market. At this time, trading volume increased  
3 significantly and became highly variable at the time that  
4 prices began to plummet.

5 In addition, the electronic limit order book in the  
6 E-mini S&P 500 futures market exhibited a significant  
7 imbalance of sell orders and buy orders. In the backdrop of  
8 declining prices, this imbalance appears to have contributed  
9 to a sudden liquidity dislocation despite increased trading  
10 volume.

11 At approximately 2:45 p.m., several sell orders  
12 would have been executed deep into the limit order book which  
13 coincided with significant loss of depth triggering the stop  
14 loss functionality. Activation of the stop logic  
15 functionality on May 6, 2010, initiated a five second pause  
16 in trading in the E-mini S&P 500 futures contract. After the  
17 five second pause, the limit order book became more balanced,  
18 and the price of the E-mini S&P 500 futures contract  
19 recovered.

20 I'll now turn it back to Robert.

21 MR. COOK: Thanks, Rick.

22 That concludes the initial portion of our  
23 presentation as to the initial findings, and we'd be happy to  
24 take questions before we move on to lines of further inquiry

25 and research.

1 Thank you.

2 CO-CHAIR SCHAPIRO: Thank you, Robert, and thank  
3 you to all of you for an excellent presentation.

4 And I would open it up to Committee members for  
5 reactions or questions.

6 MR. KETCHUM: Thank all the staff. It was  
7 extremely well done and charts very revealing.

8 A few questions on the equity side just to try to  
9 understand a little bit better. First, in particular, with  
10 respect to the two stocks and one ETF vis-a-vis the  
11 trading with regard to both bid-ask spreads and the number of  
12 trades outside those bid-ask spreads, I think it would be  
13 interesting. It appears from those three stocks that none of  
14 the -- first, there are very few trades outside bid-ask  
15 spreads on the down side, and none of them seem to track the  
16 Arca self-help moments per Dave Shillman's thing.

17 It would be interesting to see across stocks how  
18 many trades outside of the bid and offer, the NBBO track Arca  
19 self-help moments, if indeed that self-help thing resulted in  
20 avoiding liquidity in the Arca book. You would assume there  
21 were trade-throughs.

22 The other one that I'd appreciate your maybe taking  
23 a look at is the LRP information obviously is very  
24 interesting to understand the results during those times. It

25 would be good to do, again, similarly to take a look at at

1 least in a few stocks where there was significant volatility  
2 LRP trade-throughs and the breadth and dimension of the  
3 trades that occurred outside of the New York indications  
4 during the LRPs.

5           The other thing that occurs to me is that on the  
6 liquidity provider chart on page 31, I think, Jonathan, your  
7 point. If you're really looking at the logic and the  
8 implication of different types of or the absence of market  
9 maker obligations, to your point, what you're looking at is  
10 whether trading occurred on a relatively slanted basis at or  
11 around prices around there. So I think it would be good to  
12 look not just at whether liquidity was provided, but how much  
13 of that liquidity, say, was provided within 20 percent of the  
14 trading price at the beginning of the period or, again,  
15 looking at the slope from the liquidity provider standpoint.  
16 Were they providing anything close, to use old terms, market  
17 continuity during that time or were they sitting down at the  
18 bottom and simply trading? And it would be great to sort of  
19 get a feel for that kind of thing.

20           And the last suggestion would be, while some of  
21 these charts do this very well, there are obviously moments  
22 on a stock-by-stock basis, as well as the E-mini, and the  
23 E-mini ones show this, I think, particularly well, where I'll  
24 call flex trading moments, the moments when the thing tanks,

25 and the second or in between second when that pressure is in

1 there, sort of looking at liquidity providers and whether  
2 they were taking or providing liquidity at those moments when  
3 the stock turned or when the stock tanked also would be  
4 helpful in sort of identifying what really was the reaction  
5 of the major quote liquidity providers during the time.

6 MR. BRENNAN: I want to reiterate Rick's thanks for  
7 the extraordinary work, and it looks like a career's worth of  
8 work in a couple of weeks. It's really outstanding.

9 This may not surprise you. My eye was drawn to the  
10 ETF side of things, and a couple of questions. One is soft,  
11 I think, and I don't know whether you have answers to it  
12 anecdotally, which is whether in the ETF creation process,  
13 did you have any sense for whether it was an inability or an  
14 unwillingness to participate in that market when the bids  
15 fell away. Because this is a more manual process in many  
16 ways. It's much closer to the old specialist process today.

17 And so that's a question that I think would be  
18 interesting to know more about, and then a related question,  
19 thinking about the E-mini and how important are -- and it  
20 may not be important at all -- but how important are the  
21 futures markets in the hedging in the creation exercise. Is  
22 that part of this?

23 You know, in your summary points, two of the six  
24 related to the ETF business, and it's interesting and it's

25 relatively new, still relatively manual. It would be

1 interesting to know answers to both of those either  
2 statistically or probably more anecdotally.

3 Jonathan, you look like you may have those answers.  
4 I don't know whether you're supposed to answer questions or  
5 we're just supposed to ask them.

6 CO-CHAIR SCHAPIRO: Go right ahead.

7 MR. SOKOBIN: Thank you.

8 I guess where we don't have answers yet, I think  
9 we'll pass, but where we do, we'd like to provide them.

10 We talked to some participants in the ETF market.  
11 They told us by the end of the day things were sort of back  
12 to normal, and that there was, in fact, no particular issues  
13 with end of day pricing. But we did ask and did receive for  
14 some fund families information on creation and redemptions.  
15 We have only very limited information, but the information  
16 that we have to date suggests that there was no particular  
17 difference around May 6th for funds, in creation redemption,  
18 for funds that had broken trades and ones that did not.

19 CO-CHAIR GENSLER: Can I just ask? Jack might know  
20 this better, but, Jonathan, are creations and redemptions  
21 done at the end of the day or are they done, you know, down  
22 to this nanosecond sort of time frame?

23 MR. SOKOBIN: Our understanding is that creations  
24 and redemptions are only done at the end of the day.

MR. COOK: I mean, just to follow up on that one

1 point, it's an excellent question that we intend to look into  
2 further because even if you set aside the creation and  
3 redemption, obviously the price of the ETF is being driven by  
4 the trading throughout the day and the ability of market  
5 makers in ETFs, whether formal market makers or people who  
6 are substantial liquidity providers in ETFs, to hedge in the  
7 underlying securities would obviously be something we should  
8 be looking at when we're thinking about the effect of prices  
9 of the ETFs themselves.

10 So that linkage between trading or the ability with  
11 certainty to execute a hedge in the underlying stocks versus  
12 buying or selling the ETF is something that we really need to  
13 explore because that might be where some of the breakdown is  
14 occurring in the pricing of the ETFs.

15 MR. BRENNAN: It does feel that way because it  
16 encompasses many of the macro issues that you're looking at  
17 in some ways. So that's great, Robert. Thank you.

18 MS. PHILLIPS: Thank you.

19 And I also want to thank all of the staff for this  
20 very complete report. It's very impressive. You obviously  
21 have been crunching lots of numbers and printing out lots of  
22 graphs, and it's very helpful.

23 I have a few questions, and some of them I think  
24 you'll be able to answer and some may lead to maybe some

25 additional analysis.

1           First of all, I'm not as familiar with this stub  
2 quote stuff, and I guess first of all I'd like to know what's  
3 the theory behind having stub quotes at all.

4           MR. COOK: It's in some ways a vestige of a time  
5 when market makers were the central liquidity providers and  
6 there was a more formalized role for market makers in more  
7 concentrated markets. But now that we have dispersed  
8 markets, many different trading venues, many of them don't  
9 have obligations to even have market makers on some trading  
10 venues.

11           However, there continues to exist in the rules this  
12 concept of a market maker and being a market maker can  
13 provide you with certain regulatory advantages, and so some  
14 firms may try to opt into those advantages by claiming to be  
15 market makers, and whether or not they're really providing an  
16 effective market, which I think is a point Rick was also  
17 raising, is the key question here, and whether we've now  
18 observed a situation where in order to avail themselves of a  
19 regulatory status they're providing quotes that actually  
20 undermine the integrity of the markets rather than promote  
21 them, I think, is a very important policy question we need to  
22 be looking into.

23           CO-CHAIR SCHAPIRO: It really comes, doesn't it,  
24 Robert, from the obligation to make a two-sided market and to

25 have quotes on both sides, and if you really actually don't

1 want to at the end of the day provide liquidity, you just  
2 widen out that spread dramatically, and that's how you end up  
3 with a penny to \$100,000, for example, as potential quotes,  
4 but they're meaningless in some ways.

5 MR. COOK: Right. You would expect that most of  
6 the time you're putting up quotes that you don't really  
7 expect to be executed because you aren't able to provide  
8 liquidity or you're not willing to provide it, and normally  
9 it doesn't matter because no one ever or the order book never  
10 disappears before that quote would be hit.

11 But obviously, this was an instance where the order  
12 book fell away and people went right down to the stub quote.

13 MS. PHILLIPS: Okay. If you didn't have those sort  
14 of nominal quotes, stub quotes, there just wouldn't be the  
15 trades; is that right? Trading would have stopped?

16 MR. COOK: Yeah, I believe that's right. There  
17 wouldn't have been a quote to execute against.

18 MS. PHILLIPS: Yeah.

19 MR. COOK: So who's executing against them, it's  
20 likely market orders coming in saying, you know, in order to  
21 execute at whatever the market is, which is another issue  
22 that we're going to be looking at, is whether the order types  
23 sort of combine to contribute to this problem, but, yes, it  
24 would have been -- if there was no quote there, there would

25 have been no execution.

1           MS. PHILLIPS: During the day, I guess I'm  
2 wondering were there interday margin calls and did the money  
3 move as it was supposed to and were there -- and even at the  
4 end of the day for the margin calls, did everything settle  
5 out as it was supposed to?

6           I guess I'm sort of wondering if you're following  
7 the money where were the problems.

8           MR. SHERROD: Well, in the futures markets with  
9 respect to the trading that took place on May 6th, at the  
10 CME and ICE futures U.S., the clearing and settlement process  
11 worked effectively and without incident, and the CME  
12 collected and paid its clearing members in a timely manner,  
13 and ICE Clear U.S. also performed well with its clearing  
14 members. With the end of day mark to mark calculations there  
15 weren't any particular difficulties with those end of day  
16 payments.

17           MR. COOK: And then on the securities side, yes, we  
18 followed closely working with the clearing agencies. There  
19 weren't any significant issues there in terms of settlement  
20 of these trades, and obviously at the customer level the  
21 clearing firms, there were a number of margin calls that  
22 needed to be made, but we're not aware of any kind of  
23 significant issues coming out. Obviously, there are, you  
24 know, case-by-case; individual customers may have had issues,

25 but there wasn't a sort of systemic type issue coming out of

1 that.

2 CO-CHAIR GENSLER: I would add it's not that we  
3 haven't heard from some market participants as to whether any  
4 of the clearing computers may have had some nanosecond  
5 slowdowns and so forth, but in terms of the raw dollars is, I  
6 think, what Mr. Sherrod was talking about.

7 MS. PHILLIPS: So none of the firms then got into  
8 capital problems? I mean, because this is a lot of money  
9 moving around, you know, and sizable prices.

10 MR. COOK: We're not aware of any firm that had,  
11 you know, a capital problem to the point of, you know, being  
12 able to or needing to report it solely as a result of this,  
13 but there are a lot of firms out there, and I'm not sure  
14 we've been able to track through each and every one. We've  
15 been focusing, obviously, on the bigger ones and working our  
16 way down. So we might come back to you and tell you that  
17 there were some that got a little into the red depending on  
18 their trading activity, but so far we haven't identified any  
19 firms that would rise to the level of significance to raise  
20 for you.

21 MS. PHILLIPS: Okay. And this is something I guess  
22 I don't understand. If you hit -- and this is on the  
23 securities side -- if you hit one of these speed bumps with  
24 an individual stock and there's a slowdown in trading, how

25 does this then affect the indexes? And does that cause

1 problems throughout the markets?

2 MR. COOK: Well, the trading is still occurring in  
3 the security, but it's a slowdown on a particular exchange in  
4 the case of an LRP or it's a decision by one exchange not to  
5 route to another in the case of self-help. So the trading is  
6 actually still occurring during that time. Obviously the  
7 trades that would be occurring would be in some cases were  
8 at prices that were significantly lower, but also each index  
9 has its own rules about how to calculate its index pricing  
10 and often take into account things such as a trading halt or  
11 other situations with respect to a particular security, and  
12 that could all -- so you know, there are some ways in which  
13 index providers deal with these kind of events.

14 But just back to the point, the trading didn't halt  
15 in a security system.

16 CO-CHAIR SCHAPIRO: I see.

17 MR. COOK: It halted in some cases, in the  
18 particular venue -- a pause would be a better way to put  
19 it -- in the particular venue for a moment.

20 MR. BRENNAN: I just want to follow up on that  
21 because in the report I wasn't clear on that either. So  
22 could the same stock have been being executed in New York at  
23 a different price than it was executed in one of the  
24 self-help declaration venues? Simultaneous? I'm just not

25 familiar enough with it.

1           MR. SHILLMAN: Basically, when New York goes into  
2 an LRP, it will pause for, you know, a second or two or up to  
3 a few minutes. During that time the other markets will  
4 continue to trade that security, and then New York will  
5 reopen following the LRP at a print, and that print is then  
6 subject to, you know, the trade-through rule, and that would  
7 have to be brought into the national market system and the  
8 prices established.

9           MR. BRENNAN: So there's no ability to arbit beyond  
10 a second or something else exchange to exchange.

11          MR. SHILLMAN: Yeah, there isn't an ability to  
12 arbit because basically New York has shut down in trading for  
13 a few seconds or a minute and then comes back up.

14          MR. COOK: But I think is a crucial point and also  
15 raises the further research question that Rick was  
16 identifying, which is to what extent does that correlate with  
17 actual price declines in a particular security, right?  
18 Because there were a lot of broken trades in securities that  
19 aren't listed on New York. So New York only trades New York  
20 listed securities. So its LRPs only affected New York listed  
21 securities.

22                 Many, as you saw from the presentation, there are  
23 many trades that were broken in other securities that could  
24 not possibly have been affected by the LRP because those

25 securities never trade on New York. So we have to match up

1 both in terms of volume and timing the implications of an LRP  
2 or a self-help declaration what it would actually mean for  
3 liquidity in the other trading venues.

4 CO-CHAIR GENSLER: Robert, if you answer that  
5 question also on self-helps is there an opportunity to trade  
6 away from a market if NYSE Arca had these self-helps?

7 MR. COOK: Right. So if, for example, NASDAQ  
8 declares self-help against Arca, what that means is that  
9 NASDAQ will not route orders to Arca even if Arca has a  
10 better priced order, but NASDAQ can still execute orders on  
11 NASDAQ. It can still route orders to other exchanges.

12 Moreover, other routers of orders can still go to  
13 Arca. It only affects NASDAQ's routing of orders to Arca.  
14 Those who are on Arca can also choose to send their orders to  
15 another venue as well. So with the self-help the question is  
16 how much resting liquidity was there at the exchange, at Arca  
17 in this case, that got trapped there or was it still  
18 available effectively because people just didn't go through  
19 NASDAQ. They went directly to Arca, which is quite common.  
20 The more sophisticated traders wouldn't necessarily rely on  
21 one exchange to route to another. If they thought there were  
22 better prices at that other change, they'd go there directly.

23 I'll ask Dave if he wants to amplify a little more.

24 MR. SHILLMAN: You know, I think that's right, and

25 the key question I think you started to mention is whether or

1 not that liquidity in Arca and much liquidity today,  
2 particularly on the exchanges, is made through electronic  
3 market makers who are rapidly in and out of venues. You  
4 know, if, in fact, Arca appeared to have system problems,  
5 they'd then just move their quotes elsewhere. Did that  
6 liquidity really stick on Arca?

7 MS. BORN: Could you expand a little bit also on  
8 the broken trades? I guess I was a little taken aback. That  
9 seemed like a lot of broken trades to me, and were they  
10 mostly these ones at the stub quotes or is this  
11 routinely -- and have there been complaints about it?

12 CO-CHAIR SCHAPIRO: I can answer the last part.  
13 Yes.

14 (Laughter.)

15 MS. BORN: Oh, I'll bet.

16 MR. COOK: Yes, I think if you go back, if we were  
17 to go back to the graphs, many of the quotes, many of the  
18 broken trades were at the stub quotes, at the lowest, if you  
19 define that as sort of in the 90 percent to 100 percent range  
20 of loss. Broken trades happen all the time because of  
21 pricing irregularities that can happen on exchanges, and the  
22 process is designed to be one that protects parties from a  
23 situation where a trade for whatever reason gets entered into  
24 at prices that no one would deem reasonable given where the

25 rest of the market is at that time.

1            Obviously in this case there was a large number,  
2 and the exchanges convened after the market closed to try to  
3 determine where to draw the line, and then it was through  
4 those discussions that they drew the line at the 60 percent  
5 point.

6            There's a lot of arguments on either side of that  
7 question. If you break trades at a lower point, you may be  
8 discouraging liquidity providers from coming in and offering  
9 buy side liquidity because their trades will just be broken.

10           On the other hand, the lower you set the threshold  
11 if it was 70 or 80, you know, you're keeping on the books  
12 trades that are really at prices well below the market, and I  
13 think one of the things that Chairman Schapiro has asked the  
14 exchanges to do is to come up with a process for determining  
15 at what level trades would be broken if this sort of event  
16 were to happen in the future, where the key is to have  
17 predictability consistency and transparency around the  
18 process so that when you're trading today you have some  
19 assurance as to what levels you could enter into trades and  
20 have them not broken versus having them broken and rather  
21 than have it be the result of an ad hoc process.

22           I think just one thing to point out about this is  
23 that the reason we're focusing on broken trades today and as  
24 a result of this event was precisely your point, that there

25 are so many of them. Broken trades, the process has worked,

1 you know, quote, unquote, worked to some extent because it  
2 really has only hit individual securities, and in some ways  
3 that's what it was designed to do, was to get the one off  
4 unique situation where there was something peculiar about the  
5 particular stock that cause a price aberration.

6           What this event showed us was that there was a  
7 shock of some kind to the system and it led to the indices  
8 bouncing, and then some stocks just had, you know, as a  
9 result of that presumably some very significant outliers in  
10 terms of trading, and it was the volume of that that has  
11 caused us all to focus on broken trades in the way that we  
12 haven't had occasion to before.

13           MR. SHILLMAN: One thing I'll add is that the stock  
14 by stock circuit breakers that were proposed by the exchanges  
15 last week should greatly reduce, once they're implemented,  
16 the number the number of broken trades.

17           MS. PHILLIPS: Were you -- I guess both  
18 agencies -- reasonably satisfied that the market seemed fully  
19 integrated across both the derivatives and the underlying  
20 securities throughout this entire day or hour?

21           MR. SHERROD: I think that's exactly an area that  
22 we want to work on carefully. Robert and I have talked about  
23 our areas for further review, and we want to carefully and  
24 thoughtfully analyze, do a careful side-by-side review of to

25 500 stocks in the S&P versus the S&P 500 E-mini contract, but

1 to this point we have not completed that.

2 MR. COOK: I would agree with that, and I would  
3 just add that if you go back in your mind to the very first  
4 slide where we had the plunge and then recovery and those  
5 various indices --

6 MS. PHILLIPS: Yes, right.

7 MR. COOK: -- which included both the futures and  
8 the securities, in some respects you could say, yes, they  
9 were very integrated, but that also highlights the regulatory  
10 concern that a shock in one market or something that's  
11 happening in one market can also trigger events in another  
12 market or at least they move together, and it means all the  
13 more -- it just highlights the need all the more for close  
14 integration of the way we think about how the markets work  
15 together, and that if there's something going on in the  
16 securities side that could affect the futures and the futures  
17 that could affect the securities, we need to coordinate our  
18 regulatory approach.

19 And this is something that we're talking about, for  
20 example, in terms of some of the stock-by-stock type circuit  
21 breakers and any other types of regulatory initiatives that  
22 we might undertake.

23 CO-CHAIR SCHAPIRO: Thank you. That's very  
24 helpful.

1           MS. BORN: Maybe I'll start with just a follow-up  
2 on the self-help mechanism that NASDAQ activated. How long  
3 does that continue, and what's the mechanism for its  
4 discontinuation?

5           MR. SHILLMAN: Well, the way that's designed to  
6 work, when one market detects that another market is not  
7 responding within a second and does that more than once, then  
8 it is entitled upon giving notice to that other market that  
9 it's exercising self-help to route away from the market and  
10 not go to it. And what's supposed to occur at that point is  
11 there should be a conversation between the market exercising  
12 self-help and the market that is purported to be slow to  
13 figure out if there's a problem, and if so, if there's a  
14 problem, that market is supposed to market its quote as slow  
15 so no one has to go to it or, if there's not a problem or it  
16 has been solved, the market that's exercising self-help will  
17 then begin routing to it.

18           So it's a process that is designed to give an  
19 immediate recourse to a marketplace that detects another  
20 market as slow, but then there's a mechanism to basically,  
21 you know, find out what the truth is, and as soon as that's  
22 determined, then basically once that market comes up again  
23 and stops having systems problems, routing will then occur.

24           MS. BORN: And what happened on May 6th?

MR. SHILLMAN: Well, on May 6th, again, you know,

1 there's some disagreement as to whether or not the self-help  
2 exercise was legitimate or not. There are two sides to this  
3 story, but you saw from the chart there were four markets  
4 that exercised self-help against Arca during the relevant  
5 period, and towards the end of that hour, right before three  
6 and a little after three, they all began routing to Arca  
7 again.

8               So whatever the issue was was resolved within a  
9 period of, you know, ten to 15 minutes.

10              MR. COOK: It might be fair to say that self-help  
11 is something that does occur from time to time.

12              MR. SHILLMAN: It's exercised with some regularity,  
13 on average about once a week.

14              MS. BORN: Let me also ask about whether and how  
15 carefully you all are looking at the market quotes, the stop  
16 loss quotes, and the stub quotes as causative factors here, I  
17 mean, without kind of, quotes, without limit on it  
18 presumably the market would have not dropped and had  
19 executions at such a low level and probably there wouldn't  
20 have been the enormously high quotes, high executions without  
21 the stub quotes, too.

22              Is there consideration being given to requiring  
23 that orders have limits? And what are the issues involved  
24 with that?

MR. COOK: Yes, we are taking a look at that. I

1 mean, I think it would be -- at least preliminarily we're not  
2 thinking of them as causative factors in the sense of having  
3 caused the overall broad index declines in a very dramatic  
4 way, but they are certainly exacerbating factors in terms of  
5 the performance of particular securities.

6           So, yes, one of the key things we need to think  
7 about is to the extent there were market orders or stop loss  
8 market orders which are essentially orders that are pending  
9 until you hit the stop level and then they become market  
10 orders, and I think Steve had referred to that as sort of  
11 potential contributing to a cascade of orders that could push  
12 the price down; that is something we're very focused on.  
13 There are a number of competing regulatory issues here.  
14 Market orders are widely used and normally don't create  
15 problems. They give the investor the certainty of execution  
16 so they know that when they put in a order to sell,  
17 it will sell. But what they're assuming when they do that is  
18 that it will sell at a price reasonably related to what they  
19 think of as the current price and in an orderly market. And  
20 so there are a range of different approaches we can think  
21 about here. One is better education for investors about what  
22 it means to have a market order, the consequences of that,  
23 particularly if events occur like this again.

24           But there are also other types of approaches that

25 we can think about in terms of both encouraging greater use

1 of limit orders or other types of filters that might be put  
2 in place by exchanges or other trading venues that would  
3 collar orders around a certain price relative to the market.

4 Those are very significant changes that affect the  
5 way people behave in their trading activities, and so I think  
6 we want to approach that very carefully, but we clearly  
7 need to look at it very closely.

8 CO-CHAIR SCHAPIRO: Could I follow up on that,  
9 Robert? To the extent we were able or the markets proposed  
10 eliminating the use of stub quotes, does that change how you  
11 think about things like stop loss orders if stub quotes don't  
12 exist in the marketplace?

13 MR. COOK: Well, I think it might. I mean, I think  
14 all of these are interrelated just as the single stock  
15 circuit breaker will change the relative significance of  
16 certain other potential exacerbating factors. Yes, so if we  
17 were to get -- I think part of the challenge here will be to  
18 identify which are the changes that we could make most  
19 effectively without causing disruption in the markets and  
20 then once those happen, are there any other changes that  
21 would have to happen?

22 And frankly, we still need to evaluate which are  
23 the changes that would be appropriate to make in the first  
24 place. I think it's very early in the analysis of this, but

25 yes if you did something with stub quotes that might well

1 affect the need to do something with market orders.

2 MR. SHILLMAN: And certainly the outrageous prices  
3 we saw May 6th were very likely the result of stub quotes,  
4 and as we talked to market participants, we found virtually  
5 no defenders of stub quotes, and to the extent those are  
6 eliminated one way or the other, it could certainly reduce  
7 the need for action on the market order side for the  
8 outrageous prices, but I think it may still be worth thinking  
9 about whether investors should be aware they could get a bad  
10 price, albeit not a stub quote, unless they had better  
11 controls or some sort of limit price.

12 MS. BORN: I think Steve Sherrod wanted to add  
13 something.

14 MR. SHERROD: I just wanted to talk about the  
15 pre-trade automated safety features that exist on both CME  
16 and ICE. Those types of features extend to both volume, to  
17 have a volume restriction, to avoid a fat finger error, but  
18 they also extend to price. So there's a no bust range or a  
19 range of reasonability where orders must be entered within  
20 that range, and even a market order that would be entered as  
21 a market protected order to be executed at a price no more  
22 than so many points from the last transaction or the  
23 prevailing bid and offer prices.

24 So there are a range of these features already

25 built in on the futures side that keep the futures market.

1 It doesn't stop trades from executing rapidly and bringing  
2 the price up or down, but it does stop the price from spiking  
3 down to a penny or up to 100,000.

4 MR. COOK: I'd just note there are some securities  
5 markets that have similar logic in their order processing  
6 systems. It's just not uniform across all the markets. It's  
7 an area where each market has been able to offer to its  
8 participants a range of options. But because we have  
9 multiple markets with multiple different trading practices,  
10 some actually have implemented this type of logic. In fact,  
11 some of those markets had lower instances of broken trades,  
12 which may well be the result of that.

13 MS. BORN: I also just wanted to address the  
14 futures markets in other broad-based securities indices. I  
15 know that the E-mini, particularly the June 2010 contract,  
16 was a very big percentage of the overall contracts in  
17 broad-based securities index futures, but I wondered whether  
18 or not an investigation of what went on in the other index  
19 futures is ongoing, number one.

20 And also, whether there has been an analysis of  
21 individual stock futures and how they behave compared to the  
22 behavior of some of the aberrational individual securities  
23 trading.

24 MR. SHERROD: We have begun looking into the other

25 markets. In particular, we've received a report and

1 discussed trading in the Russell 2000. It is ongoing. As  
2 you mentioned, most of the trading, about 78 percent of all  
3 the trading is in the E-mini, and we focused on that first,  
4 but we are looking into the others.

5 With respect to the second question, my  
6 recollection of single stock futures trading volume for the  
7 day was about 12,000 contracts. So it wasn't that terribly  
8 significant and it's lower in our priority list.

9 MS. BORN: Thank you.

10 CO-CHAIR SCHAPIRO: Are any of our phone  
11 participants interested in comments or questions?

12 MR. ENGLE: Yes, I would like to ask a question.  
13 This is Rob Engle.

14 CO-CHAIR SCHAPIRO: Please go right ahead.

15 MR. ENGLE: I was very interested in the graph on  
16 Slide 45 that showed the -- one of the slides that showed a  
17 reduction in liquidity supply. I wondered whether this is an  
18 extraordinary amount of reduction or whether this happens  
19 typically when the market has high volatility.

20 MR. KIRILENKO: Thank you very much, Professor.  
21 This is Andrei Kirilenko from the CFTC.

22 I think this is another issue that we'd like to  
23 investigate further. At this point we're able to analyze or  
24 this very particular period of time but we'd like to go back

25 and see what happened before 2:30, what happened after 3:00,

1 what happened on other days and investigate further how  
2 liquidity is typically provided and then contrast it with  
3 what happened specifically on this day.

4 MR. ENGLE: Right. Because we would anticipate  
5 that as volatility goes up, you would see reduction of  
6 liquidity supply in many cases.

7 MR. KIRILENKO: We've, again, focused on the six  
8 largest. It would also be interesting to drill down to what  
9 are the -- who sort of stepped in and provided liquidity  
10 during that time, how it was provided. The information, the  
11 data that we have is very granular. We could look at whether  
12 the quote was sitting there or whether it was picked off. We  
13 could look further into this and see, sort of drill down into  
14 more details on how the liquidity provision changes as the  
15 broad market experiences periods of increased and volatile  
16 volume and volatile prices.

17 MR. ENGLE: And is there a similar analysis that  
18 you are doing for the securities? For the equities?

19 MR. SOKOBIN: Yes. We will be doing a similar  
20 analysis. The slide that we showed on liquidity takers or  
21 providers was just the first step in putting together the  
22 order books and trying to understand where liquidity was  
23 being provided and where it was being taken.

24 MR. ENGLE: Okay. Thank you.

CO-CHAIR SCHAPIRO: Jonathan, what was that slide

1 number just for Professor Engle's -- he joined us a little  
2 bit late.

3 MR. SOKOBIN: That was Slide 31.

4 CO-CHAIR SCHAPIRO: Slide 31. Okay.

5 MS. O'HARA: Hi. This is Maureen O'Hara. I wonder  
6 if I could ask a question.

7 CO-CHAIR SCHAPIRO: Of course.

8 MS. O'HARA: My question actually builds on  
9 something you've just been speaking about, which is the  
10 construction of the order book. I wondered if anyone has  
11 looked yet at cancellations and how those contributed to the  
12 hollowing out of the order book as the, you know, sort of  
13 problems became apparent. That's sort of question number  
14 one.

15 And then question number two is just a technical  
16 question maybe you could help me with. I know that a lot of  
17 the exchanges sell their own data feeds to, well, HF firms in  
18 particular, but to other firms as well, and I wondered to  
19 what extent are the proprietary data feeds of the  
20 exchanges -- how much out of sync were they with the regular  
21 consolidated data feed?

22 That is, I'm trying to understand whether, in fact,  
23 the problems affected all of the information that everyone in  
24 the market was getting or if it was affecting some people

25 differentially.

1           MR. BERMAN: Those are great questions, and they're  
2 questions that we definitely would love to know the answer  
3 to. On the first part about the cancellation of the orders  
4 themselves, so far we have a full slide on this that we'll  
5 explain later in the presentation. The data that we've  
6 received has been on the top of the order book for each of  
7 the individual exchanges. The cancellation information that  
8 we received has been on broken trades, trades that were  
9 actually canceled later.

10           We have not yet analyzed the depth of the order  
11 book to see to the extent that orders were actually placed  
12 and then they were later withdrawn, which we know is a common  
13 technique in many types of proprietary trading strategies and  
14 algorithmic strategies so that's an area of keen  
15 investigation.

16           As we'll get into, the volume of data is enormous.  
17 We're dealing with literally tens and tens of billions of  
18 individual data elements to try to reconstruct some of those  
19 order books.

20           We have also heard, to the second part of your  
21 question, on the feeds themselves. The data that we receive  
22 is quite precise. It has eight significant digits so it  
23 goes down to the millisecond level, but what we have heard  
24 directly from the exchanges and from those who have sent us

25 the information, just because something says it was traded or

1 a bid was placed at 3.567 milliseconds does not mean that it  
2 came before the 3.568.

3           There are latencies in the different feeds. The  
4 time that it takes an order to transmit from one to another,  
5 clocks get out of sequence. So that's one of the areas that  
6 we need to investigate. To try to minimize that, we've  
7 grouped everything by the second. So if you recall some of  
8 the charts where we see apparent trade-throughs, some of  
9 those might be artifacts of saying, well, that actually  
10 happened the second before and that just happened to be on  
11 the one second boundary, but it is an area that we do need to  
12 discover a lot more information on.

13           MR. KIRILENKO: On the E-mini side, Professor  
14 O'Hara, we are fortunate that the trading occurs in one  
15 trading venue and all orders are matched in one by matching  
16 algorithm. So we are able to reconstruct the limit order  
17 book, and we are very keenly looking at cancellations when  
18 they happen, who submitted them, and how they were done, as  
19 well as other more granular information on the limit order  
20 book side.

21           MS. O'HARA: Well, thank you.

22           CO-CHAIR SCHAPIRO: Are there other questions?

23           (No response.)

24           CO-CHAIR SCHAPIRO: Okay. With that then, I guess

25 I'll turn it back to Robert and Steve to talk about

1 additional data requirements and the next steps we're going  
2 to take.

3 MR. COOK: Thank you.

4 So we'll just discuss briefly some of the further  
5 analysis, and we've touched on a lot of this already in the  
6 Q&A. So this will be familiar territory, but why don't we  
7 begin with Slide 48 on the securities side?

8 And I'll turn this over to Gregg to just sort of  
9 describe what this slide is about.

10 MR. BERMAN: Thanks.

11 On Slide 48, what we've done is try to present a  
12 bit of a framework for how we're going to think about both  
13 the next steps and the analyses going forward. As you can  
14 see from the questions today from all the members, there are  
15 many different directions and many different lines of  
16 inquiry.

17 So what we tried to do was put them together in a  
18 framework so that we can look for similar lines of inquiry.  
19 Where we start is at the beginning of the day when there were  
20 clearly some external shocks in the market or signals.  
21 Whether or not they were real or whether or not they were  
22 perceived remains to be seen, but for certain it was a  
23 jittery day in the stock market.

24 Different market participants behaved differently

25 under these circumstances. Here we list four: market

1 makers, retail investors, institutional investors, algorithm  
2 of traders, each with their own decision making process and,  
3 most importantly, each with their own time horizon for making  
4 those decisions.

5           The bottom part of the chart shows that once those  
6 decisions are made, they are made under different venues, and  
7 here we list three different markets just to give an example.  
8 Those markets represent different categories. So one can  
9 think about the market as being different exchanges. You  
10 have Exchange 1, Exchange 2, and Exchange 3, and one exchange  
11 will be affected by what happens on the other, whether it be  
12 through self-help or through LRPs.

13           You can also think about the markets as being  
14 different venues for how to think about the trading  
15 themselves, derivatives markets, futures markets, cash  
16 markets, et cetera.

17           When you have rebalancing, what happens in the cash  
18 markets happens in the futures markets; what happens in the  
19 futures markets happens in the derivative markets, and it  
20 becomes a bit of a circle. So there's a lot of intermarket  
21 feedback.

22           Even the order types themselves have a bit of a  
23 feedback as we've heard about today where if the market goes  
24 down and you invoke a stop order, that can drive the market

25 down even further and you have a bit of a cascade.

1           So we're thinking about all of these problems  
2 within the framework that's listed here, and the important  
3 thing is when we start to think about how these market  
4 changes and the propagation of market signals creates a  
5 feedback loop that then exacerbates the situation even  
6 further.

7           When we think about feedback, we think about folks  
8 changing their decision based on information that then  
9 changes their decision again and again, and so forth.  
10 Because of the time scales involved, it is unlikely that  
11 investors are making real time decisions or even that traders  
12 are making real time decision by watching the prices. These  
13 things happened at the second or the sub-second level.

14           So to the extent that decisions were being  
15 triggered by changes in prices, this most likely happened at  
16 the algorithmic side of things where things can happen much  
17 faster, or they happened in a pre-programmed way through stop  
18 loss orders, market orders, et cetera, that were triggered  
19 automatically. But we're looking less at the instances where  
20 folks have made their own trading decisions based on watching  
21 a millisecond by millisecond feed.

22           MR. COOK: Thanks, Gregg.

23           So within that overall context, we've identified on  
24 the next Slide 49, some general themes that pick up on some

25 of the discussion we've been having and areas that we want to

1 continue to explore at a very high level.

2           You know we in the first instance plan to examine  
3 further the types of activities that might suddenly generate  
4 enormous demand for liquidity to buy. We spoke earlier about  
5 the linkages between the futures markets and lots of  
6 discussion today about the E-mini on the S&P 500, and  
7 linkages between those and the cash markets and the extent to  
8 which changes in one may have driven the other, which is  
9 particularly important given the price discovery interplays  
10 that are going on. That's going to be a continuing area of  
11 focus.

12           We'll also be looking at whether there are other  
13 types of trading behavior that could have contributed in  
14 varying degrees to the downward price pressure. For example,  
15 to what extent were firms employing directional strategies  
16 that were triggered by signals that attempt to exploit  
17 short-term price movements? This is a type of trading  
18 activity that the Commission has raised in connection with  
19 its concept release on equity market structure and one that  
20 we'd like to understand more in terms of the events of May  
21 6th.

22           Short selling is also another area we'll be looking  
23 at as we talked about before, and while the overall short  
24 selling on May 6th for the day doesn't seem to account for a

25 disproportionate percentage of trading volume, we need to

1 examine further what was really going on in the 20 minute  
2 period, and as you will recall from the slides on the stub  
3 quotes, there were a lot of short selling trades that came up  
4 at that level.

5           So these are some of the broader types of issues  
6 we're going to be looking at to try to isolate what some of  
7 the triggers, or that may or may not be the right word, but  
8 what some of the key instigators were of the overall decline  
9 in prices.

10           We'll also be looking much further into what  
11 happened to liquidity, studying particularly the activities  
12 of market participants who normally provide liquidity in the  
13 marketplace. As we've said, based on anecdotal evidence,  
14 there's some suggestion that a large number of trades  
15 executed against stub quotes -- sorry -- based on anecdotal  
16 evidence and the stub quote trades, it would appear that some  
17 professional liquidity providers temporarily didn't  
18 participate in the market on the buy side, and we need to  
19 understand how these firms are acting.

20           They may have been acting appropriately under  
21 current rules, but we need to look at the data and determine  
22 whether they withdrew from the market, to what extent, and  
23 why, and as we've also been discussing, we need to look at  
24 issues of potential trap liquidity due to different trading

25 rules or conventions across different market venues as we've

1 been talking in terms of LRPs and the exercise of self-help,  
2 whether that was appropriate under the circumstances or not.

3           There's also some emerging evidence that large  
4 internalizers may have ceased providing executions. We've  
5 been talking about the exchanges as the key execution venues,  
6 but if you go back for a second to the previous slide when we  
7 were looking at different market types, you should also be  
8 thinking of large internalizers of orders as a way, another  
9 type of market, a very significant market out there for the  
10 execution of orders and their activities or their changes in  
11 their behavior during this time could well have had a  
12 significant impact on the way that orders, particularly  
13 retail orders, were affected during this time.

14           A third area of further inquiry will be the role  
15 that different order types play. I think we've talked a lot  
16 about this already.

17           A fourth will be understanding the experience of  
18 ETFs. We've talked about the need to look at the behavior of  
19 market makers in ETFs and whether their ability to hedge in  
20 the underlying securities may have affected their willingness  
21 to trade the ETFs and at what prices. We're going to be  
22 looking at the creation of redemption process and to see what  
23 evidence we can find of any variation in creation and  
24 redemption activity that might be related to these events.

We also need to examine further whether the use of

1   ETFs by institutional investors, who often use ETFs to  
2   quickly acquire broad market exposure, whether that led to  
3   any selling pressure on the ETFs as the market began to  
4   decline, and of course, we'll also be looking at whether the  
5   exercise of self-help against Arca was a factor in the  
6   experience of ETFs because many ETFs are listed on the Arca  
7   market.

8                   And then finally, we'll we keeping our  
9   investigation open to considering other contributing factors  
10  that may be identified to us as we continue our research and  
11  analysis. For example, there were some questions today about  
12  the role of the kind of systems and how they work together,  
13  and whether there was any latencies in the messaging traffic  
14  that may have contributed to this in one way or another would  
15  be something we want to understand both for purposes of  
16  figuring out to what extent that contributed to what we  
17  observe, but also for purposes of forming policy responses.

18                   And just finally we'd like to spend a minute.  
19  We've been alluding for a while to the issues of data and  
20  just want to describe once again sort of what the context is  
21  in which we're trying to gather data.

22                   And I'm going to turn this over to Gregg to  
23  describe. This is Slide 51 in your materials.

24                   MR. BERMAN: So I thought we'd just take a minute

25 to trace the history of a trade and to get an idea of the

1 type of data that we need in order to reconstruct the events  
2 of May 6th and the data that we've analyzed so far.

3           So the trades that are indicated in blue at the  
4 center of the chart, these are the trades that do happen on a  
5 millisecond by millisecond level. They come across the  
6 ticker; they come across the consolidated tape, and we've had  
7 access to them. They generally come from a single source of  
8 information that is supported by the New York Stock Exchange  
9 called TAQ: trades and quotes, and we've spent most of our  
10 time analyzing the data in that database.

11           In addition, there are two other databases that are  
12 part of that same suite of offerings. One shows the national  
13 best offer and the national best bid, and we've also been  
14 able to absorb that information, line it up with the trade  
15 information, and produce the charts and the graphs and  
16 analysis that we've showed so far.

17           Yet a third database gives you the best bid and  
18 best offer on an exchange by exchange basis, and we've been  
19 able to analyze some of that information, and part of that  
20 information has been part of our analysis so far. So trades,  
21 quotes, both at the national level and the exchange level,  
22 all in three different databases, different formats,  
23 different systems and require different ways of merging that  
24 information.

What we have not analyzed yet is the order book

1 that sits behind each exchange's best bid and the exchange's  
2 best offer. Those books are built by events that each  
3 exchange keeps track of. Now, the exchanges themselves need  
4 to do this in real time because they need to determine  
5 whether or not there's a match and whether or not they have  
6 the best bid or the best offer, and if they're going to  
7 reroute or if they're going to accept that and do it  
8 internally.

9           In order for us to reconstruct that, we almost have  
10 to reconstruct our own mini version of a trading floor and  
11 pretend to be an exchange for the day, taking in all the  
12 different orders and the order book. So that is something  
13 that we have started engaging and will take some time to  
14 complete that.

15           One thing to note is that we only have the order  
16 book for or the potential to see the order book for the  
17 exchanges. Internalizers we would not have any information  
18 on that, and those are shown in dotted lines, and we need to  
19 do this both for the offer book as well as for the bid book.

20           The orders themselves and how they were processed,  
21 whether or not that was a limit order, a market order,  
22 contingent order, et cetera, that comes yet in a separate  
23 feed from what's called audit trails as opposed to the order  
24 book, and those are kept by the exchanges also in different

25 formats, in different databases, and get you back to the

1 introducing broker where the trade was originally introduced  
2 and how it originated.

3           Since there are multiple exchanges, we will be  
4 collecting and have received some of that information already  
5 and build that into the analysis to see who is actually  
6 selling what and why. But we'll get more of the why in terms  
7 of the nature of whether it was a limit order than the who  
8 because the who only brings us back to the broker.

9           If we actually want to go back to the original  
10 decider of the trade, we then have to go to each broker and  
11 request what are called blue sheets, and in this database,  
12 and each broker will have their own forms of this, we will  
13 find some of the identifiers for whether or not it was a  
14 hedge fund or an asset manager or a retail client.

15           The data is not designed across the board to be  
16 collected in a massive scale. So the names of the  
17 participants will only be as good as the way that they are  
18 known by the accounts to the brokers. So the same hedge fund  
19 can show up under five different names, and we may have to  
20 try to piece together some of this information.

21           What's not shown are some of the colocators, folks  
22 who sponsored access who we would not have direct information  
23 necessarily from the blue sheets to understand exactly the  
24 orders and when they were placed.

MR. COOK: Thanks, Gregg.

1           So I think the overall point is that what's within  
2 the dotted line on this chart is stuff that we can -- is data  
3 that we can have ready access to at any given time, and as  
4 you move farther away from that, you're talking about pulling  
5 in data from various sources that may not be maintained in a  
6 consistent format and that takes varying degrees of time to  
7 get in house and then has to be validated and made consistent  
8 in order to be able to be analyzed.

9           That's the world that we live in today. The SEC  
10 has a meeting scheduled for Wednesday to propose rules that  
11 would implement what we are calling a consolidated audit  
12 trail, which would really be designed to address precisely  
13 this point, to give us the ability and the exchanges in their  
14 regulatory capacity, the ability to very quickly get  
15 information about orders from the point of origination all  
16 the way through their life cycle, through execution in a  
17 standardized format. It's a major undertaking, as you can  
18 imagine, given the complexities involved, but it would move  
19 us substantially forward in being able to undertake the type  
20 of analysis that we'd all like to undertake quickly in  
21 connection with an event such as May 6th.

22           Thank you.

23           MR. SHERROD: I just want to echo some of the  
24 difficulties Robert has we also have on the futures side, but

25 in many respects we have it much easier in that the E-mini

1 trades exclusively on the CME. So that data source is  
2 confined to one exchange.

3 As Gregg mentioned though, we, too, have to do  
4 inquiries to the clearing members and the carrying firms to  
5 find out the names of the accounts. We have a large trader  
6 reporting system where we receive the names of the accounts at  
7 the end of the day, but for the intraday trade register, we  
8 have to make reverse inquiries as does the SEC to find out  
9 the accounts that are being executed through either the CME  
10 platform or through the ICE platform.

11 I'd like to turn to Rick for the next steps on our  
12 analysis.

13 MR. SHILTS: Yes, and this will be slide 53.

14 While the CFTC staff has been able to gain insights  
15 into the events that occurred on May 6th, staff will continue  
16 to review other information that it collects or will collect  
17 as it relates to this market. Specifically, staff will  
18 continue reviewing information from a special call on over 40  
19 traders for their trading activity in the E-mini S&P 500 and  
20 Russell 2000 futures contracts on May 6, 2010.

21 A special call is a CFTC directive to a trader  
22 holding a reportable position to furnish any pertinent  
23 information concerning the trader's positions, transactions or  
24 activities.

Staff also will continue reviewing information from

1 a special call on swap dealers about their activity in  
2 over-the-counter broad based security index derivative  
3 markets on that day.

4 Staff also will continue its detailed review of  
5 trader activity on May 6th through an examination of trade  
6 register data. To date staff has reviewed over 25 gigabytes  
7 of data in over 307,000 files related to the individual  
8 trades that occurred that day, with more data expected.

9 In addition to these areas of analysis specific to  
10 May 6th, staff at the CFTC continues to review electronic  
11 trading and its effect on liquidity provision in the futures  
12 market. Specifically, staff is focused on the practices of  
13 high frequency trading and algorithmic trading.

14 We are also carefully reviewing pre-trade automated  
15 safety features.

16 Now, turning to the next Slide 54, in addition,  
17 both SEC staff and CFTC staff working together will review  
18 correlated assets and equities including single stocks,  
19 mutual funds, and ETFs, as well as options in the futures  
20 market. The study would partly focus on examining  
21 cross-market linkages by analyzing trading and stock index  
22 products, such as equity futures, ETFs, equity index options,  
23 and equity index OTC derivatives using, to the extent  
24 practicable, market data, special call information and order

25 book data.

1           Now I'll return it to Robert.

2           MR. COOK: Thank you.

3           We'll be happy to take any discussional questions  
4 or comments you might have.

5           MR. KETCHUM: I think the first basic comment is  
6 that looking through on each of the points, you've really  
7 anticipated a number of my questions before, and I think  
8 you're looking at the right things.

9           Gregg, I would suggest from experience of having  
10 tried to put things together in the fall of '08 that first  
11 you have my deepest sympathy, and secondly, wherever you can  
12 as you move through the blue sheet information and piecing  
13 together the other pieces of the order audit trails, et  
14 cetera, where you can focus on flex moments and very short  
15 pictures of this rather than trying to recreate the whole  
16 period at least as a first step I think you may dramatically  
17 accelerate your time to be able to do some thinking about it  
18 or for us to be doing some thinking about it.

19           So I would suggest you think about at least doing  
20 it in stages because the data is truly overwhelming.

21           Robert, on the point you made you made with respect  
22 to latencies, one latency over and above the ones I think you  
23 mentioned that I think would be of value to look at is the  
24 latency of different lines exchanges and internalizers are

25 using to make their self-help decisions since some use common

1 lines, some use direct lines to different exchanges, and it  
2 would be very interesting to understand whether the aberrant  
3 use of self-help during that day had something to do with  
4 latencies in lines as opposed to latencies in Arca.

5 I guess the last point I'd make, which is not to  
6 suggest you recreate this in looking at other periods, but I  
7 think we can overdo to some degree from a precision  
8 standpoint between this particular experience which more  
9 underlines the brittleness in the markets we need to address  
10 than necessarily the one and only experience.

11 I think it would be valuable to at least on a broad  
12 based way compare what happened on May 6th with what happened  
13 in the fall of '08, which is the other time in which  
14 unprecedented large numbers of trade cancellations occurred  
15 in the equity markets, albeit in a time far more dire than  
16 the news that you've described on the 6th.

17 And the last piece that would be helpful for you to  
18 go back on particularly the extent this Committee is going to  
19 consider things and as both agencies have indicated they plan  
20 to consider the questions of system-wide circuit breakers as  
21 well as any pauses in the market. There was one or two  
22 events far earlier before system-wide circuit breakers were  
23 expanded where those circuit breakers were hit. There was a  
24 good deal written and analyzed vis-a-vis gravity impact and

25 concerns with respect to lower level circuit breakers, and it

1 would be great if the staff could go back and pull together  
2 the analysis that was at least done at that time.

3 CO-CHAIR SCHAPIRO: Anyone on the phone have  
4 anything further?

5 MR. ENGLE: Just one comment. This is Rob Engle.

6 When you look at the linkages between derivatives  
7 markets, you're talking about options makers who are  
8 presumably continuously hedging and some of this event could  
9 actually spill into the options market in a way which we  
10 haven't seen yet. But it would be interesting to understand  
11 how those feedbacks work because they're probably working in  
12 the same direction.

13 MR. COOK: Yes, we agree, and that's something we  
14 intend to look at. When we think of the derivatives markets,  
15 it won't just be the futures markets. It will also be the  
16 options markets, and to the extent we can the OTC markets as  
17 well.

18 CO-CHAIR GENSLER: I want to ask Professor Engle.

19 So earlier you made a very good suggestion about  
20 looking at other periods of volatility, and Mr. Ketchum  
21 suggested the fall of '08 or whatever volatile periods I  
22 thought, but was it those periods that you were thinking  
23 about, Professor Engle, to look back at the volatile periods  
24 like in the crisis?

MR. ENGLE: Yes.

1 CO-CHAIR GENSLER: Or some other periods?

2 MR. ENGLE: No, I think it would be interesting to  
3 see periods in the crisis, but also we've had shorter  
4 intermittent periods of high volatility, of course, since  
5 then that perhaps might more resemble this event, and so  
6 maybe in less detail but more scope would be useful.

7 CO-CHAIR GENSLER: Great. So we also want to  
8 recognize and set aside time for our respective  
9 Commissioners. So I don't know which way I'm supposed to do  
10 this, but I'll turn left first. We usually do it by  
11 seniority, but Commissioner Dunn.

12 COMMISSIONER DUNN: Thank you, Mr. Chairman.

13 And thank the great panel we've got here and the  
14 hard work that the staff has done on putting this together.  
15 When I was acting chair of the Commission, I had indicated  
16 that I thought we needed to have joint meetings with the SEC  
17 and to look at harmonization of our regulations and to look  
18 at risk that transcends both agencies, and I think this is an  
19 important step.

20 I note that it took an act of Congress to be able  
21 to do that, and this is probably in looking at the makeup of  
22 this Commission and the start that we've got here, this may  
23 go down as one of the more successful things that this  
24 session of Congress has done.

I would also, Mr. and Madam Chairman, be remiss if

1 I didn't tell you what a great job you two are doing in  
2 working together on harmonization. There's hardly a week  
3 goes by that I don't hear from someone saying that, gee, what  
4 great cooperation the Gary and Mary team are doing, and I  
5 think it bodes well for both of our Commissions on doing  
6 this.

7 I was doing some research on business process  
8 reengineering getting ready to look at what Congress is going  
9 to lay in our lap as we came up, and I came up with this  
10 quote from one BPR group, and it said, "The problem is that  
11 we're governing in the 21st Century with processes and  
12 organizations designed in the 19th Century to work well in  
13 the 20th Century."

14 And their results were they thought they needed a  
15 new process and organization for governance in the 21st  
16 Century, and I think this group is putting us well on that  
17 way. Thank you again for your help.

18 CO-CHAIR GENSLER: Mike, thank you very much.

19 I normally call it the Mary and Gary show, but you  
20 know.

21 But Commissioner Walter. I don't remember your  
22 seniority. So I just want to make sure I have it in the  
23 right order.

24 COMMISSIONER WALTER: It doesn't matter.

CO-CHAIR SCHAPIRO: Okay. All right.

1           COMMISSIONER WALTER: I would like to add my thanks  
2 particularly to the staff for their tireless efforts and just  
3 note in addition to our upcoming meeting on Wednesday I think  
4 this shows the important of cross-market information being  
5 available to regulators. It is very important to me that as  
6 we go forward, for example, with respect to the OTC markets,  
7 that regulators have full information regardless of  
8 jurisdictional lines, and I think this exercise underscores  
9 that.

10           So my thanks to everyone in the room, particularly  
11 those of you who have volunteered in some way, shape or form  
12 to work with us.

13           CO-CHAIR GENSLER: Commissioner Sommers.

14           COMMISSIONER SOMMERS: Thank you.

15           I also want to thank both Chairman Gensler and  
16 Chairman Schapiro for pulling this Committee together. I  
17 have found the dialogue today to be enormously helpful.

18           And thank you to the staff for all of your work on  
19 this report, and I just want to say that I look forward to  
20 your continuing analysis and the information that we're going  
21 to get on your further steps.

22           Thank you.

23           CO-CHAIR GENSLER: Commissioner Aguilar.

24           COMMISSIONER AGUILAR: Thank you.

Good morning. First I want to apologize for

1 arriving late this morning, but months ago I had committed to  
2 keynote the start of the 2010 Compliance Week conference this  
3 morning. I certainly understand the importance of today's  
4 meeting.

5           And I, too, would like to thank members of the  
6 staff of both Commissions for their hard work, which is  
7 evident, and I also want to thank the members of the Joint  
8 Advisory Committee for their willingness to give their time  
9 and expertise to these efforts. Thank you.

10           And certainly not least, I also want to thank our  
11 respective Chairmen, the Mary and Gary show, and my fellow  
12 Commissioners at the SEC and the CFTC for agreeing to form  
13 this Committee.

14           The market disruption of May 6th and the inability  
15 to promptly analyze and fully understand it has created a  
16 sense of urgency and certainly deserve your and our  
17 attention. It is essential that we respond to the events of  
18 May 6th and address the issues they raise. Today's agenda  
19 was a step forward in that discussion.

20           As we undertake this important work, however, we  
21 must also remain focused on the broader issues related to the  
22 financial markets. As Committee members, you have been  
23 called together at a time of historical significance. It  
24 should not be lost on anyone that the essential role of the

25 financial services sector is to facilitate the allocation of

1 capital to productive uses. The financial crisis revealed a  
2 clear failure of markets and the financial sectors to serve  
3 this role with widespread mispricing of assets, trillions in  
4 losses, and damaging levels of unemployment and under  
5 employment, together with an unprecedented concentration of  
6 wealth at the top.

7 As this Committee does its important work and  
8 prepared recommendations for the SEC and the CFTC, I ask that  
9 you remember that our markets must serve the public interest  
10 by facilitating the real economy and sustainable shared  
11 prosperity.

12 Thank you.

13 CO-CHAIR GENSLER: Thank you, Commissioner Aguilar.  
14 Commissioner Chilton.

15 COMMISSIONER CHILTON: Thanks.

16 There is an old saying in Washington. When in  
17 doubt set up a task force or a committee, and in this case I  
18 think it's really needed and not just on the May 6th stuff,  
19 but for these emerging issues. so we can be more nimble and  
20 quick and look around the corner. I think it's very helpful  
21 to have this Committee.

22 I really hate it when in Washington we use  
23 this -- and nobody has used this particular phrase  
24 here -- but you know, this perfect storm stuff. I mean, I

25 think it sort of says we don't know what happened. Just all

1 of these different things, and in listening to staff, who I  
2 know have worked really hard and done yeoperson's service,  
3 I'm reminded -- remember Colombo? He would say, "And one  
4 more thing," or, "if you could just explain this also," as he  
5 was walking out the door, and in the meetings that we've had,  
6 and I assume my fellow Commissioners in all of our  
7 surveillance meetings, I keep feeling like there's one other  
8 question I want to ask and one more thing.

9           But in listening to staff, you have those  
10 questions, too. I mean, you're going to get more  
11 information. You're going to look at the algo trading.  
12 You're going to look at the flash trading. You're looking at  
13 ETFs, and to me it's sort of a microcosm in part at least of  
14 the entire economic calamity that we faced. You could make  
15 arguments about why do we end up, you know, in 2008 and 2009  
16 in this circumstance, legislation, regulation or lack  
17 thereof.

18           But there are lots of questions that we still don't  
19 know the answers to, whether or not it's with regard to the  
20 OTC markets, you know, 600 trillion out there. Our futures  
21 markets are only 5 trillion. It just seems to me we've got a  
22 lot of questions, and one more thing out there.

23           So my take-away from this is it's great we're doing  
24 this. I look forward to getting more information, but

25 overall we need financial regulatory reform. We need that

1 bill passed that's going to not have going to seek additional  
2 information as part of as special committee, as part of a  
3 special call or all of these inside the beltway phrases. We  
4 need to constantly get this information, have the regulatory  
5 tools and the funding in order to effectively implement them  
6 and insure that we have efficient, effective markets that are  
7 devoid of fraud, abuse and manipulation. And one more thing:  
8 that we protect consumers above all.

9           So thanks very much.

10           CO-CHAIR GENSLER: Thank you, Commissioner Chilton.  
11           Commissioner Paredes.

12           COMMISSIONER PAREDES: I just want to add my thanks  
13 to everybody who has been working literally around the clock.  
14 On the staff, this has been an incredible amount of work and  
15 an incredible degree of effort on your part and an incredibly  
16 impressive showing to this point.

17           We know there's still a lot of work to be done, and  
18 I certainly look forward to the continued efforts in terms of  
19 getting and analyzing the data and seeing where the data  
20 ultimately takes us.

21           I also want to extend my thanks to the members of  
22 the Advisory Committee for their sacrifices and all the  
23 efforts that they'll be making in the coming months to help  
24 us analyze and understand and figure out appropriate

25 responses.

1           And of course, to Mary and Gary for their  
2 leadership.

3           CO-CHAIR GENSLER: Thank you, Commissioner Paredes.  
4 Commissioner O'Malia.

5           COMMISSIONER O'MALIA: Chairman Schapiro, thank you  
6 for hosting this inaugural event. I'm pleased that we have,  
7 the Commission, appointed the distinguished group of experts  
8 from the securities and future industry in order to advise  
9 our Commissions on possible solutions to May 6th. I  
10 appreciate their willingness to serve and hopefully we'll  
11 have some solid recommendations that the two Commissions can  
12 implement.

13           Based on first-hand information I've received in  
14 the last several days, I encourage the committees to conduct  
15 a more thorough investigation of the significant delays in  
16 processing and clearing of trades caused by the overwhelming  
17 volumes in the futures markets.

18           In a lot of this information I believe that the  
19 statement on page 7 of the staff report which reads,  
20 "Clearing and settlement processes worked efficiently,  
21 effectively, and without incident significantly understates  
22 the challenges created by the flash crash in the clearing and  
23 settlement business." I've learned that thousands of trades  
24 were unconfirmed long after trading stopped on May 6th.

On May 7th temporary shutdowns occurred in clearing

1 queues resulting in the backlogs of hundreds of thousands of  
2 trade messages that lasted over the weekend. Without proper  
3 confirmation of trades, FCMs and clearing members were unable  
4 to accurately mark their books or set appropriate margin  
5 levels with the highest degree of confidence.

6 I hope the Committee will, working with the staff,  
7 will further investigate this matter and report back to the  
8 Commissions regarding the impacts of the clearing and  
9 settlement business as a result of the extreme trading  
10 volume.

11 I also am interested to know if the futures  
12 exchanges have implemented a crisis strategy in order to  
13 respond to the next spike in trade volume.

14 I am particularly interested in final  
15 recommendations from this panel regarding technology specific  
16 issues that the newly established CFTC Technology Advisory  
17 Committee can explore in the futures industry.

18 With respect to time constraints, I have provided  
19 some written lists of concerns which I hope the Committee  
20 will consider in their deliberations.

21 Finally, I'd like to thank the hard work of the  
22 staff, both the SEC and CFTC and to produce a very thorough  
23 analysis of the events on May 6th.

24 Thank you.

1 CO-CHAIR SCHAPIRO: Thank you all.

2 We have one Committee organizational item to  
3 address before we recess the meeting. So you'll have to bear  
4 with me. We actually have to approve our bylaws.

5 Briefly, the bylaws specify that the Joint  
6 Committee will be jointly presided over by Chairman Gensler  
7 and me or by our designated federal officers when directed to  
8 do so.

9 In addition, the bylaws require that with respect  
10 to voting a Committee member must be participating in a  
11 meeting in person or by telephone or similar communication to  
12 cast a vote. When a decision or recommendation of the Joint  
13 Committee is required, the presiding officer will request a  
14 motion for a vote. Any member may make a motion and vote on  
15 that motion. No second is required.

16 Committee action based on a vote requires approval  
17 of a simple majority of the votes cast at a meeting at which  
18 a quorum is present.

19 I think a lawyer wrote all of that.

20 Before voting on this item, can I ask for a motion  
21 to approve the bylaws?

22 PARTICIPANT: So moved.

23 PARTICIPANT: Second.

24 CO-CHAIR SCHAPIRO: Is there any discussion on the

25 bylaws?

1 (No response.)

2 CO-CHAIR SCHAPIRO: All in favor.

3 (Chorus of ayes.)

4 CO-CHAIR SCHAPIRO: Any opposed?

5 (No response.)

6 CO-CHAIR SCHAPIRO: Thank you. The bylaws have  
7 been approved.

8 Let me again thank the Commissioners of both  
9 agencies for their presence today at the Joint Committee  
10 meeting. I also again want to thank the staffs of the SEC  
11 and the CFTC for their excellent presentations and analysis  
12 today. I know how many Saturdays and Sundays I've spent on  
13 the phone with all of you, and you are true public servants,  
14 and I am incredibly grateful to you.

15 You've done an incredible job analyzing data,  
16 presenting preliminary findings in such a short period of  
17 time, and we are very, very grateful.

18 I also want to thank the Advisory Committee members  
19 for reviewing and digesting the joint report in a compressed  
20 period of time and for offering today your insights and  
21 recommendations on how we might go forward.

22 We will set up the next meeting of the Joint  
23 Committee shortly. You've clearly given us some homework to  
24 do and some additional data and analysis that will be useful

25 to you as you continue your work.

1           So with that, Chairman Gensler, I don't know if you  
2 have any more comments?

3           CO-CHAIR GENSLER: I just again wanted to thank my  
4 fellow Commissioners and the Commission of the SEC and  
5 Chairman Schapiro for pulling this together and our Advisory  
6 Committee members on short notice -- Susan Phillips reminded  
7 me I called her on a Saturday evening to ask whether we could  
8 announce her name on Monday. It was very, very generous of  
9 you -- for pulling this together.

10           I can tell by the quality of the questions and the  
11 dialogue today we as two Commissions are going to get a great  
12 deal from this Advisory Committee.

13           And lastly, I want to thank the staffs again that  
14 really, as Chairman Schapiro has said, has shown what public  
15 service can be about. It is really great standards. It is a  
16 high bar you have set though.

17           CO-CHAIR SCHAPIRO: So with that, the open meeting  
18 of the Joint Committee will recess to allow for the Committee  
19 members to have lunch and discuss administrative issues such  
20 as the ethics rules and travel forms that you have to file  
21 with us and public record requirements, and following that  
22 administrative discussion the meeting of the Joint Committee  
23 will adjourn for the day. Thank you all very much.

24           (Whereupon, at 11:54 a.m., the Joint Advisory

25 Committee meeting was adjourned.)

1 REPORTER'S CERTIFICATE

2

3

4 I, Jon Hundley, reporter, hereby certify that the foregoing  
5 transcript of 115 pages is a complete, true and accurate  
6 transcript of the testimony indicated, held on May 24, 2010,  
7 at Washington, D.C. in the matter of: Joint CFTC-SEC  
8 Advisory Committee on Emerging Regulatory Issues.

9

10

11 I further certify that this proceeding was recorded by me,  
12 and that the foregoing transcript has been prepared under my  
13 direction.
